

Report of the Small-Scale Otolith Exchange  
of Northeast Atlantic Mackerel  
(*Scomber scombrus*)  
2020-2021  
(SmartDots event 280)

by María Rosario Navarro (National Centre IEO-CSIC, CO Santander, Spain)  
and Jens Ulleweit (TI-SF Bremerhaven, Germany)

## **1. INTRODUCTION.**

Atlantic mackerel (*Scomber scombrus*) is a pelagic species of high commercial importance in European waters. Living on both sides of the North Atlantic, ICES currently uses the term “Northeast Atlantic (NEA) mackerel” to define the mackerel present in the Northeast Atlantic with a distribution range from the Iberian Peninsula in the South to the Nordic Sea, including Icelandic and Greenland waters and the Western Baltic. Recent ICES stock advice based on an age-based analytical assessment model shows that the stock of NEA mackerel is still on a high level but decreasing the last years.

Age readings on mackerel are important input data for the assessment and carried out by a number of laboratories using international agreed ageing criteria.

The first reported workshop on mackerel ageing was held in Lowestoft in 1987, preceded by a first otolith exchange in 1986, and followed by another workshop in 1995 in Spain and one exchange in 2002. A third exchange was performed in 2008, followed by a workshop that was held in 2010 in Lowestoft again, and a small exchange in 2014, which was the first one using images only (via WebGR). All previous workshops and exchanges have had outcome stating the overall agreement to be low but fair but skewed towards having a higher agreement on the younger ages. All workshops discussed and tried to standardize age reading methods by preparing a manual and a reference collection of agreed age otoliths.

The last exchange and workshop held in San Sebastian in 2018 were the first ones performed via SmartDots. Quite a lot in terms of ironing out was achieved, through on-screen discussion of difficult and/or old otoliths and calibration, some of the differences in age interpretation between readers. The participants agreed to employ the revised ageing guidelines in their age estimation. The overall results of the workshop exercise showed an improvement in the agreement between all readers and especially expert readers, regarding the exchange carried out before the workshop exercise. However, the agreement between readers for otoliths with older ages (from age 6) continued to be very low.

During the last workshop ageing protocol/guidelines were revised and completed with the aim to employ these guidelines to eliminate some of the problems with e.g., split rings in the otolith structures. In conclusion, the participants to the workshop recommended that exchanges and workshops on age reading of NEA mackerel should be held regularly and the next exchange was scheduled for 2020. However, due to the pandemic, the start of the exchange was delayed until the beginning of 2021. This report represents the results of this exchange.

## **2. MATERIAL AND METHODS.**

A total of 37 readers from 12 European countries (13 laboratories) participated in the exchange. Two more readers (one from The Netherlands and another from Norway) were originally included in the exchange although in the end they did not participate in the exercise. The reader's number of each participant was assigned based on the new protocol to weight the experience of readers in reading exchanges. Thus, an experience ranking number was obtained for each reader from the information provided by the participants in the Excel table “Scheme for ranking SmartDots Users” (Table 2.1).

**Table 2.1. Experience ranking number and other readers' information of the participants of the small-scale exchange of NEA mackerel otoliths.**

Exp. rank. N	Reader Id	Readers name	Laboratory	Country	Readings in assessment

The exchange was carried out via SmartDots, the web application developed by ICES to facilitate the setup of exchanges, workshops and training events (<http://www.ices.dk/marine-data/tools/Pages/smartdots.aspx>). A total of 237 otolith images from the main areas of mackerel distribution were included in the exchange. Following the recommendations of WKMACQI (Workshop on Mackerel biological parameter Quality Indicators) (ICES, 2018), it was attempted that the spatial and temporal coverage, as well as the length and age range, of the mackerel otoliths of the exchange corresponded with the coverage in the assessment (Table 2.2).

Table 2.2. Spatial and temporal coverage of the otoliths used in the small-scale exchange of NEA mackerel otoliths.

Total			110	127	237		

Although SmartDots application can generate an automatic analysis of the results, it was necessary to apply some nuances to the results that were impossible to perform with the program. Also all the annotations of reader R29 were not included in the automatic analysis, probably because one or more steps were missed during the annotation process. Hence, the exchange results were analysed using the spreadsheet of GuusEltink (Eltink, 2000) instead.

### 3. RESULTS.

A table with the participants' readings can be found in Table 3.1. In addition to the estimation of the age of the exchange otoliths, readers were asked to assign the quality to each reading according to the "3 point grading system" (AQ1, AQ2, AQ3) recommended by WKNARC (ICES, 2011), shown in the table in blue (AQ1 annotations) and brown (AQ2 annotations). Readings with AQ3 were not included in the analyses.

Two analyses were performed for the total of areas: i) all readers, and ii) advanced readers (readers whose age estimations are used in the NEA mackerel assessment).

**3.1. ALL READERS’ ANALYSIS.**

The modal age range of all readers’ analysis was 0-19 for the whole set of otoliths, with more than 10 otoliths of modal ages 0-10, 4 otoliths of modal age 11, 2 otoliths of modal age 12-14 and 1 otolith each of modal ages 16 and 19. The overall agreement was 64.7%. The best agreement was obtained for otoliths of modal age 0 (91.3%) and modal ages 1-3 (78.9, 77.5 and 79.1%, respectively). Otoliths with modal age >5 had less than 60% agreement. The least agreement was obtained for otoliths with modal age >10 (25.0-29.4% agreement) (Table 3.1.1). Overall CV was 34.3%. CV peaked at 36.6% for modal age 1. The lowest values were obtained for modal ages 3-7 (15.4-16.5%). The CV value of 318.3% for modal age 0 is probably obtained due to the difficulty of the Eltink-sheet application to calculate the CV for modal age 0 when one or more readers have a different estimation (Table 3.1.1). Overall bias was -0.28, being the bias values between 0.09 and -0.17 for younger ages (modal ages 0, 2-6) and values <-0.25 for older ages (Table 3.1.1).

The standard deviation showed an increasing of its values with the age for all readers combined, contrary to what happens with the percentage of agreement that showed a decreasing of its values with the age (Figure 3.1.1).

By component, the best agreement was obtained for the North Sea component set of otoliths (76.3%) while the lowest agreement was obtained for the Southern component (56.8%) and Northern distribution (59.6%). The lowest CV value was obtained for the Northern distribution (15.9%), being the highest value for the Western component (66.8%). Bias ranged from 0.02 (Western component) to -0.48 (Northern distribution) (Table 3.1.2).

A total of 83 otoliths from the 237 otoliths of the exchange had an agreement between all readers of more than 80%. From these, only 7 otoliths had 100% agreement (ages 0-3), 32 otoliths had 90-99% agreement (ages 0-5) and 45 otoliths had 80-89% agreement (ages 0-6) (Table 3.1.3). Also, a total of 23 otoliths had less than 30% agreement.

Table 3.1.1. Summary of the average percentage of agreement (PA), coefficient of variation (CV) and relative bias by age (Small scale otolith exchange NEA mackerel, all readers' analysis). (MA: modal age; N: number of otoliths).

The results of the reader against modal age bias test are shown in Table 3.1.4. Readers R2, R4, R5, R6, R7, R12, R15, R20, R23, R35 and R37 showed no bias regarding the modal age, while readers R14, R17 and R36 showed possibility of bias. Reader R30 also showed possibility of bias regarding the modal age, although this reader only participated partially in the exchange, making only 16 annotations (from the total of 237 otoliths). The rest of the readers showed certainty of bias regarding the modal age.

**Table 3.1.4. Reader against modal age bias test (Small scale otolith exchange NEA mackerel, all readers' analysis). - = no sign of bias ( $p > 0.05$ ); \* = possibility of bias ( $0.01 < p < 0.05$ ); \*\* = certainty of bias ( $p < 0.01$ ). (MA: modal age).**

The inter-reader bias test showed four groups of affinity, with no bias or only possibility of bias between readers. One group was formed with readers R1, R8, R9, R10, R21, R26, R27, R28, R29 and R31. A second group was formed with readers R2, R4, R5, R6, R7, R12, R14, R15, R17, R19, R20, R23, R35, R36 and R37. A third group was formed with readers R3, R13, R18, R22, R24, R25, R33 and R34. And a fourth group was formed with readers R11, R16 and R32. Also, reader R13 showed no bias with reader R19, reader R25 showed no bias with readers R17, R19 and R36, and readers R16 and R32 showed no bias with readers R31 and R33 (Table 3.1.5). Reader R30 also showed no bias with most readers in the inter-reader bias test, although, as explained before, this reader only participated partially in the exchange, making only 16 annotations (from the total of 237 otoliths).

Table 3.1.5. Inter-reader bias test (Small scale otolith exchange NEA mackerel, all readers' analysis). - = no sign of bias ( $p>0.05$ ); \* = possibility of bias ( $0.01<p<0.05$ ); \*\* = certainty of bias ( $p<0.01$ ).

Figure 3.1.2 shows age bias plots with the mean age recorded and the standard deviation of each age reader and all readers combined plotted against the modal age. Readers R2, R4, R5, R6, R7, R10, R12, R13, R14, R15, R17, R19, R20, R23, R35, R36 and R37 showed better estimation regarding the modal age at least until age 7, most of them showing underestimation regarding the modal age in older ages. Readers R1, R8, R9, R21, R26, R27 and R28 showed underestimation in most ages regarding the modal age. This underestimation was more pronounced in readers R16, R31, R32, R33 and R34. On the other hand, readers R3, R11, R18, R22, R24 and R25 showed mostly a light overestimation of most ages regarding the modal age. Finally, reader R29 showed overestimation in ages 0-2 and underestimation in all other ages with regards to the modal age. As commented before, reader R30 made only 16 annotations (ages 0-3). In the case of all readers combined plotted against the modal age, there was a good estimation until age 7, with an underestimation of older ages.

**Figure 3.1.2.** Age bias plot with the mean age recorded  $\pm$  2stdev of each reader and all readers combined and plotted against the Modal Age (Small scale otolith exchange NEA mackerel, all readers' analysis).

Most readers showed similar mean length-at-age for ages <9, but showed higher values for older ages regarding the mean values of all readers together. Also, for some readers these differences were more pronounced: reader R11 showed lower mean length-at-age of most ages; readers R29 and R31 showed lower mean length-at-age <3, but higher values for the other ages; reader R32 showed higher values for ages >4; and reader R34 showed higher values for all ages (Table 3.1.5; Figure 3.1.3). The 16 annotations of reader R30 showed also lower mean length-at age-for ages 0-3, compared with the values of all readers.

**Table 3.1.5. Mean length-at-age (mm) of each reader (Small scale otolith exchange NEA mackerel, all readers' analysis).**

**Figure 3.1.3. Mean length at age of each reader compared with the mean values of all readers together (Small scale otolith exchange NEA mackerel, all readers' analysis).**

The error matrix of all readers regarding the modal age showed the best values ( $\geq 0.65$ ) for ages 0-3 (respectively, 0.88, 0.75, 0.73 and 0.75). These values decrease with older ages, being the values of less than 0.50 for age  $\geq 7$  (Table 3.1.6).

**Table 3.1.6. Error matrix of all readers regarding the modal age (Small scale otolith exchange NEA mackerel, all readers' analysis). (A: age; MA: modal age; black: rate of age estimates coincident with MA; red: rate of age estimates no coincident with MA; white: rate of rejected otoliths by modal age).**

### 3.2. ADVANCED READERS' ANALYSIS.

The modal age range of the advance readers' analysis (readers whose age estimations are used in NEA mackerel assessment) was 0-19 for the whole set of otoliths, with more than 10 otoliths of modal ages 0-10, 3 otoliths of modal age 12, 2 otoliths of modal ages 11 and 13 and 1 otolith each of the modal ages 14-16 and 19. The overall agreement for the readers involved in assessment was 67.8%. The best agreement was obtained for otoliths of modal age 0 (91.1%) and modal ages 1-3 (79.1-82.1%). Otoliths with modal age >6 had less than 60% agreement. The lowest agreement was obtained for otoliths with modal ages 15 and 16 (25.0 and 26.1% agreement, respectively) (Table 3.2.1). Overall CV was 24.1%. Highest values of CV were for modal ages 1 and 2 (30.5 and 20.6%, respectively). For the rest of modal ages the CV was <20% (Table 3.2.1). Overall bias was -0.21, being the bias values between 0.25 and -0.11 for younger modal ages (0-8) and values <-0.29 for older ages (Table 3.2.1).

The standard deviation showed a increasing of its values with the age for all readers combined, contrary to what happens with the percentage of agreement that showed a decreasing of its values with the age (Figure 3.2.1).

By component, the best agreement between the advanced readers was obtained for the North Sea component set of otoliths (78.1%) while the lowest agreement was obtained for the Southern component (60.5%). The lowest CV value was obtained for the Northern distribution (12.8%), being the highest value for the Western component (37.9%). Bias ranged from 0.02 (North Sea components) to -0.29 (Northern distribution) (Table 3.2.2).

Table 3.2.1. Summary of the average percentage of agreement (PA), coefficient of variation (CV) and relative bias by age (Small scale otolith exchange NEA mackerel, advanced readers). (MA: modal age).

MA	N	PA	CV	Bias

Figure 3.2.1. Coefficient of variation (CV%), percent of agreement and the standard deviation (STDEV) plotted against Modal Age (Small scale otolith exchange NEA mackerel, advanced readers' analysis).

Table 3.2.2. Summary of % agreement (PA), coefficient of variation (CV) and bias obtained by component (Small scale otolith exchange NEA mackerel, advanced readers' analysis).

Component	PA	CV	Bias
Southern component	60.5	25.7	-0.07
Western component	69.3	37.9	-0.01
North Sea component	78.1	19.6	0.02
Northern distribution	64.3	12.8	-0.29

A total of 80 otoliths from the 237 otoliths of the exchange had an agreement between the advanced readers of more than 80%. From these, 22 otoliths had 100% agreement (ages 0-3), 35 otoliths had 90-99% agreement (ages 0-5) and 23 otoliths had 80-89% agreement (ages 0-6, 8) (Table 3.2.3). A total of 15 otoliths had less than 30% agreement.

**Table 3.2.3. Otoliths with more than 80% agreement between all readers involved in assessment (Small scale otolith exchange NEA mackerel, advanced readers' analysis). (MA: modal age).**

MA	100%	90-99%	80-89%

TOTAL	22	35	23

The results of the reader against modal age bias test for the advanced readers are shown in Table 3.2.4. Readers R2, R4, R5, R6, R7, R12, R17 and R20 showed no bias regarding the modal age, while readers R15 and R19 showed possibility of bias. The rest of the readers showed certainty of bias regarding the modal age.

**Table 3.2.4. Reader against modal age bias test (Small scale otolith exchange NEA mackerel, advanced readers' analysis). - = no sign of bias ( $p>0.05$ ); \* = possibility of bias ( $0.01<p<0.05$ ); \*\* = certainty of bias ( $p<0.01$ ). (MA: modal age).**

Figure 3.2.2 shows age bias plots with the mean age recorded and the standard deviation of each advanced reader and all these readers combined plotted against the modal age. Readers R2, R3, R4, R5, R6, R7, R10, R12, R15, R17, R19, R20, R22 and R24 showed better estimation regarding the modal age at least until age 7, most of them showing underestimation regarding the modal age in older ages. Readers R1, R8, R14, R16, R21 and R32 showed underestimation in most ages with regards to the modal age and readers R11, R13, R18 and R25 showed mostly a light overestimation of most ages regarding the modal age. In the case of all advanced readers combined plotted against the modal age, there was a good agreement until age 8, with underestimation of older ages.

Most readers showed similar mean length-at-age, at least until age 8, with regards to the mean values of all advanced readers together. However, differences occurred for some readers: reader R11 showed lower mean length-at-age of most ages; readers R16 and R25 showed slightly higher values for ages  $\geq 4$  and reader R32 showed lower values for ages 0 and 1 but higher values for ages  $\geq 3$ . Also,

reader R14 showed lower mean length-at-age 1, while reader R21 showed a higher value for this age (Table 3.2.5; Figure 3.2.3).

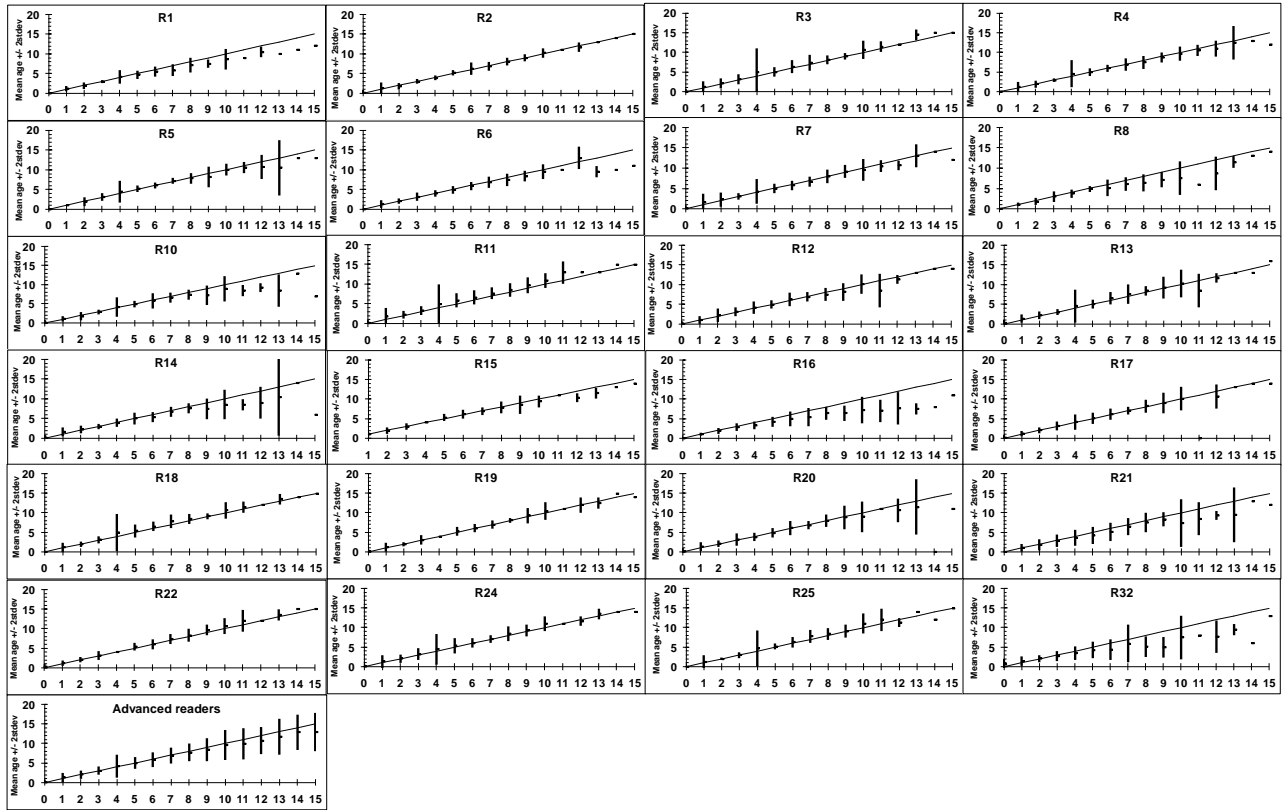

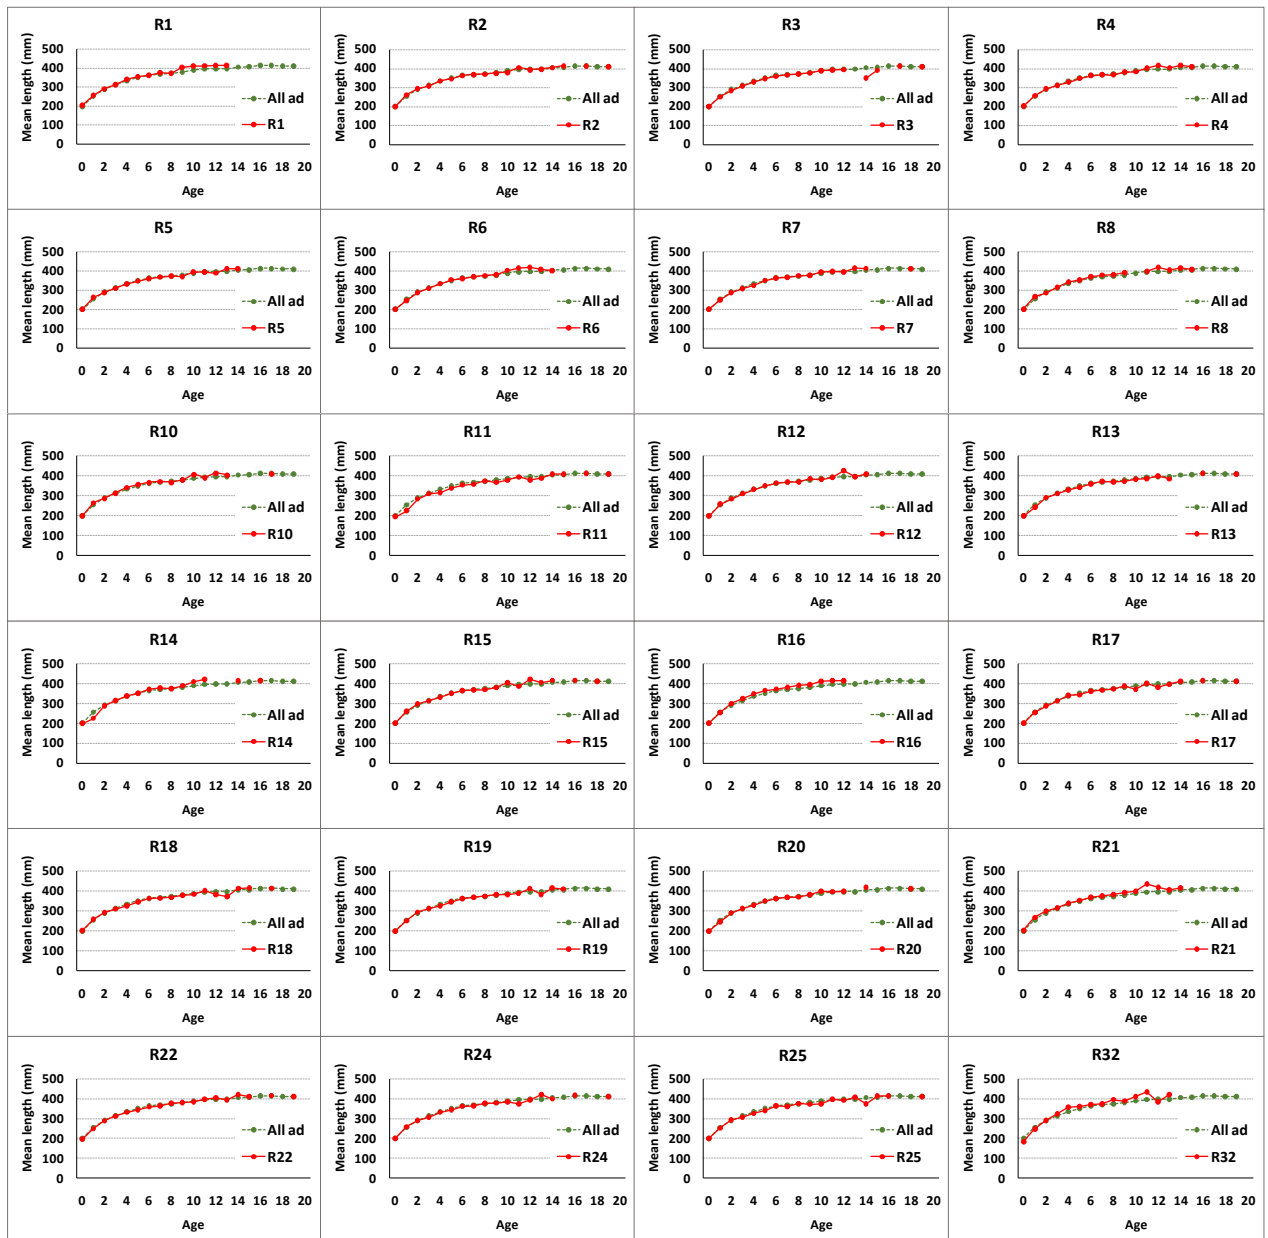

Figure 3.2.2. Age bias plot with the mean age recorded +/- 2stdev of each reader and all readers combined and plotted against the modal age (Small scale otolith exchange NEA mackerel, advanced readers' analysis).

Table 3.2.5. Mean length-at-age (mm) of each advanced reader (Small scale otolith exchange NEA mackerel, advanced readers' analysis).

**Figure 3.2.3. Mean length-at-age of each advanced reader compared with the mean values of all advanced readers together (Small scale otolith exchange NEA mackerel, advanced readers' analysis).**

The error matrix of the advanced readers regarding the modal age showed the best values ( $\geq 0.65$ ) for ages 0-5 (respectively, 0.90, 0.80, 0.78, 0.82, 0.68 and 0.65). These values decrease with older ages, being the values of less than 0.50 for ages  $\geq 9$  (Table 3.2.6).

The analysis of the error matrix of each advanced reader regarding the modal age (MA; for MA with 10 or more otoliths, ages 0-10) showed that all advanced readers presented values  $\geq 0.80$  of coincidence with MA 0, with the exception of reader R32 (0.50). Most readers showed values  $\geq 0.75$  of coincidence with MA 1, while readers R11 and R14 showed the lowest values (0.45). Most readers showed values  $\geq 0.70$  of coincidence with MA 2 and 3, while R21 showed the lowest values (0.50 and 0.47, respectively) (Table 3.2.7).

This analysis also showed that readers R2, R3, R4, 45, R6, R13, R15, R18, R19, R20, R22, R24 and R25 presented values of  $\geq 0.65$  of coincidence with most of the MA (in 7 or more ages), while readers R16, R21 and R32 presented values  $< 0.50$  of coincidence in most ages.

**Table 3.2.6. Error matrix of all advanced readers regarding the modal age (Small scale otolith exchange NEA mackerel, advanced readers' analysis). (A: age; MA: modal age; black: rate of age estimates coincident with MA; red: rate of age estimates no coincident with MA; white: rate of rejected otoliths by modal age).**

#### 4. DISCUSSION AND CONCLUSIONS.

This exchange was carried out using the SmartDots application, which most participants had already used before and they were familiar with it. However, some problems occurred during the exercise, mainly related to the position of the reading line and the quality of some images. Due to the complaints of some participants about the position of the reading line, it was decided to eliminate it so that each reader could make their annotations where they could best observe the annuli in the otoliths. The problem of the quality of the images was more difficult to solve as they were provided

by different laboratories, each one with different equipment that produced images of different quality. However, the readers were encouraged to add their comments in the SmartDots application when they found an image of bad quality and make use of the “3 point grading system” (AQ1, AQ2, AQ3) recommended by WKNARC (ICES, 2011), assigning AQ2 or AQ3, respectively, for difficult and/or impossible age estimation of these otoliths.

The average values of the percentage of agreement (64.7%) and CV (34.3%) for all readers were slightly worse than last workshop exercise in 2018 (WK-EX 2018) (66.8% and 31.4%, respectively). These values are better for the advanced readers’ analysis (67.8% of agreement and 24.1% of CV), although these are also slightly worse than the expert readers analysis of WK-EX 2018 (73.2% and 16.4%, respectively). These results may have been influenced by the larger number of participants in the present exchange (a total of 37 readers, 24 of them advanced readers) in comparison with WK-EX 2018 (a total of 23 readers, 15 of them expert readers).

A good agreement ( $\geq 60\%$ ) was obtained for modal ages 0-5 for all readers and 0-6 for advanced readers. The best agreement ( $\geq 70\%$ ) remain similar to WK-EX 2018, ages 0-3 for all readers and 0-4 for advanced readers (although in the case of expert readers of WK-EX 2018, modal age 7 also had  $>70\%$  agreement).

The error matrix showed good values ( $\geq 0.60$  of coincidence with the modal age) for ages 0-4 for all readers, and for ages 0-5 for advanced readers, being the best values ( $\geq 0.75$ ) for ages 0-3 (for both, all and advanced readers).

For all readers, a total of 83 otoliths had  $\geq 80\%$  agreement (modal ages 0-6), 7 of these otoliths having 100% agreement (modal ages 0-3). In the case of advanced readers, a total of 80 otoliths had  $\geq 80\%$  (modal ages 0-8), 22 of these otoliths with 100% agreement (modal ages 0-3). These otoliths will be included as otoliths of reference in the Age Reader Forum site. A selection of these otoliths is included in annex A.1. A selection of otoliths with low agreement is also shown in annex A.2.

To sum up, there has been a slight decrease in the overall agreement, both for all and advanced readers since last workshop in 2018, but maintaining a good agreement until age 5/6, with the best values for ages 0-3. Agreement for otoliths with modal age 5 and older remains quite low. As pointed out during last workshop in 2018 (ICES 2019), this situation seems to have a difficult solution as the age estimation in these older otoliths is quite subjective and each reader seems to have a different interpretation of the growth pattern in these older otoliths.

In light of these results the continuation of exchange and workshops for NEA mackerel is recommended. A next workshop could be scheduled for 2023.
