1 Executive summary

Based on the work realized during WKAMDEEP1 (2013), the Working Group on Biological Parameters (WGBIOP 2017) identified the need for a follow-up workshop on age estimation methods of deep-water species. WKAMDEEP2 took place in 2018 during which the ageing of seven deep-water species was reviewed: blackspot seabream (*Pagellus bogaraveo*), tusk (*Brosme brosme*), greater silver smelt (*Argentina silus*), blue ling (*Molva dypterygia*), ling (*Molva molva*), greater forkbeard (*Phycis blennoides*) and black scabbardfish (*Aphanopus carbo*). The aims of the workshop in 2018 (WKAMDEEP2) were to assemble a group of experts to further develop the ageing protocols and assess the precision of age readings of these species. For each species, an easy-to-use ageing manual was agreed upon by all participants. These manuals are considered necessary and sufficient for a generic age reader of deep-water fish to provide reasonably accurate and precise age estimates. During WKAMDEEP2, an exchange of 50 otolith images per species was conducted. To continue to improve both the quality and the capacity of age readings of deep-water species, WKAMDEEP2 recommended that small exchanges of the same material were to be carried out after two and four years, before arranging a third workshop, WKAMDEEP3, in 2023. The small-scale exchange in 2020/2021 was carried out according to the recommendations of WKAMDEEP2, but unfortunately the results from the exchange got delayed due to COVID-19. The images used in 2020/2021 were the same as in 2018, enabling analyses of internal consistency for each reader participating in both 2018 and 2020/2021. The exchange was carried out according to the recommendations of WGBIOP, using the SmartDots European tool for the interpretation of otolith images. The overall results for all age readers and species combined showed relatively low precision, compared to other species, with a weighted average Coefficient of Variation (CV) of 20% (from 9% to 29% according to species), a weighted average Percent Agreement (PA) based on modal ages of 47% (from 34% to 69% according to species) and an Average Percent Error (APE) of 16% (from 6% to 30% according to species).

2 Participant list

A total of 17 readers from Portugal, Greece, Norway, Iceland, Spain, Faroe Islands, France, Italy, and Denmark participated in the exchange of deep-water species. (Table 2.1).

3 Introduction

3.1 Background

The exchange was a follow-up on two previous workshops, WKAMDEEP1 from 2013 (ICES, 2013) and WKAMDEEP2 from 2018 (ICES, 2019). The workshop in 2013 (WKAMDEEP1) provided a review of validation and corroboration work on each species, as well as a discussion on the procedures used by individual laboratories and recommendations for further development. Since there are very few age readers of most deep-water species, sometimes just one, the 2013 workshop decided that age readers of any of these species should preferably consider themselves as experts on the whole group of slow growing deep-water fish. It was believed that this would facilitate age reading comparisons as a measure of quality assurance. The aim of the 2018 workshop (WKAMDEEP2) was to assemble this group of experts to further develop the competence and capacity regarding age reading of this group of fish. Since several laboratories recruited new age readers around 2018, and there has been a general increase in research effort on vulnerable species, it was consented that the most pressing issue at the workshop in 2018 was to develop easy-to-use species-specific age reading manuals, which would allow any generic deep-water age reading expert to take part in age reading on any specific species. The species-specific age reading manuals were completed shortly after the workshop in 2018 and were available for the age readers to use while ageing the otoliths in the 2020/2021 exchange (ICES, 2019).

For all the species represented in this exchange, the ICES Working Group on Biology and Assessment of Deep-sea fisheries (WGDEEP) gives advice for the different stocks. Table 3.1 provides an overview of for which species there are age-based assessments. Even if the age data is not used directly in the assessment model, most of the species are considered data poor or data limited, hence the trends in length-and weight at age are paid attention to and considered.

Table 3.1 Overview of ageing data used for stock assessment for each species.

Species	Latin name	Ageing data used for stock assessment
Black scabbardfish	<i>Aphanopus carbo</i>	No
Greater forkbeard	<i>Phycis blennoides</i>	No
Ling	<i>Molva molva</i>	Yes
Blue ling	<i>Molva dypterygia</i>	Yes
Greater silver smelt	<i>Argentina silus</i>	Yes
Tusk	<i>Brosme brosme</i>	Yes
Blackspot seabream	<i>Pagellus bogaraveo</i>	No

3.2 Implementation of the small-scale exchange

The small-scale exchange of deep-water species was, according to the recommendations of WKAMDEEP2, initiated two years after the workshop. The exchange opened in November 2020 and closed on 15th of March 2021. Unfortunately, the analysis of the results got delayed about a year, due to challenges related both to COVID-19 and to the work staff's priorities.

The report first gives a short overview of the results from all the species in the deep-water species exchange, and afterwards the complementary results for all the different species are presented. At the end, the internal consistency results for age readers participating in both the 2018 workshop and the 2020/2021 exchange are provided.

4 Methods

In this small-scale exchange, all age readings were done using images of the calcified structure, either the whole or the sectioned otolith, depending on the species (Table 4.1) and no physical otoliths were exchanged between readers. The images used were the same as those prepared for the workshop in 2018, enabling internal consistency analyses for readers who participated in both the workshop and the small-scale exchange.

Table 4.1: Number of otoliths and preparation method for each species

Species	Latin name	Sampling number	Otolith preparation
Black scabbardfish	<i>Aphanopus carbo</i>	50	Transverse sections
Greater forkbeard	<i>Phycis blennoides</i>	50	Transverse sections
Ling	<i>Molva molva</i>	50/29	Transverse sections/whole otoliths
Blue ling	<i>Molva dypterygia</i>	50	Transverse sections
Greater silver smelt	<i>Argentina silus</i>	50	Whole otoliths
Tusk	<i>Brosme brosme</i>	50	Whole otoliths
Blackspot seabream	<i>Pagellus bogaraveo</i>	50	Whole otoliths

Before the SmartDots tool analyses, each reader was ranked based on their years of experience with age reading in general and age reading of each species. The readers were also categorized as either advanced or basic. If a reader is “advanced”, they are considered well trained and they provide ages for stock assessment or similar purposes. The SmartDots tool uses the ranking of readers in the analysis for weighing purposes.

4.1 Bias of age reading

The bias of age reading among readers for each deep-water species was analyzed using the SmartDots tool (<https://www.ices.dk/data/tools/Pages/smardots.aspx>), as recommended by WGBIOP as a standard tool for exchanges and analyses of the results (ICES, 2017). From SmartDots, a reporting module runs the analyses via an R script to produce a R Markdown document, and excel sheets, which gives easy access to the results from the exchange. For this report, seven events were analyzed (Event 315-321). The analyses follow traditional methods where the level of accuracy compared to modal age was indicated by Percent Agreement (PA), bias tests and plots. The level of precision, i.e., the reproducibility of age estimates, was indicated by the Coefficient of Variation (CV). The tables and plots presented in the results are from the Guus Eltink Excel sheet ‘Age Reading Comparisons’ (Eltink,

A.T.G.W, 2000). Additional analyses of age data included were the Average Percent Error (APE) and Age Error Matrices (AEM).

4.1.1 Percent Agreement (PA)

The Percent Agreement (PA) is the ratio between the total number of age readings in agreement with modal age and the total number of age readings for that sample per reader and modal age:

$$PA = \frac{n_{modalage}}{n_{total}} * 100$$

4.1.2 Coefficient of Variation (CV)

The CV is calculated as the ratio between the standard deviation (σ) and mean value (μ) per reader and modal age:

$$CV = \frac{\sigma}{\mu} \cdot 100\%$$

4.1.3 Average Percent Error (APE)

APE was calculated based on the method outlined by Beamish & Fournier (1981). This method is not independent of fish age and thus provides a better estimate of precision. As the calculations of both CV and APE pose problems if the mean age is close to 0, all observations for which the modal age was 0 were omitted from the CV and APE calculations.

The Average Percent Error is calculated per sample as:

$$APE = \frac{100\%}{n} \sum_{i=1}^n \left| \frac{a_i - \bar{a}}{\bar{a}} \right|$$

where a_i is the age reading of reader i and \bar{a} is the mean of all readings from 1 to n .

4.1.4 Age Error Matrix (AEM)

Age Error Matrices (AEM) were produced following procedures outlined by WKSABCAL (ICES, 2014) where the matrix shows the proportion of each modal age mis-aged as other ages. The sum of each row is 1, which equals 100%. The age data was analysed twice, first including all readers and then only the “advanced” readers.

4.1.5 Otolith Growth Analysis

SmartDots provides a measure of distance between the annotations made by the readers and thus provides a measure of growth increment width. This data is used to establish growth curves for each fish per reader.

5 Overview of samples and readers

An overview of the samples, including sampling year, area, strata, quarter, number of samples, modal age, and length range, for each species are presented together with the expertise level of and reader code for each participant.

5.1 Black scabbardfish

Table 5.1.1: Overview of samples used for the black scabbardfish exchange.

Year	ICES area	Strata	Quarter	Number of samples	Modal age range	Length range
2015	27.5.b	27.5.b	3	50	4-9	780-1090 mm

For black scabbardfish, only one reader was classified as “advanced”, but for SmartDots to be able to do comparative analyses all readers were considered “advanced” (Table 5.1.2)

6 Results of age readings

The results of the age reading exchange for deep-water species showed that the weighted average Percent Agreement (PA) based on modal ages for all readers combined was 47% (from 34% to 69% according to species), the weighted average Coefficient of Variation (CV) was 20% (from 9% to 29% according to species) and the Average Percent Error (APE) was 16% (from 6% to 47% according to species). The average CV was lower or equal compared to the previous exchange for all species apart from tusk, but the precision of age reading is still low compared to other species. However, for deep-water species, a CV around 20% is considered fairly good, thus for ling, blue ling, greater silver smelt and tusk with CVs between 9 and 18%, the precision should be considered as very good (Table 6.0 and Figure 6.0). The Percent Agreements (PA) were the same or had slightly increased since 2018.

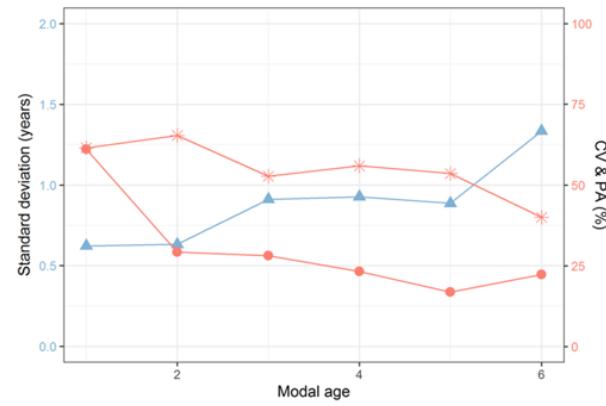

For most species, the precision (CV) was fairly equal throughout the modal age range, with a slight decrease with increasing age. For blue ling however, there was a sudden increase in the CV after modal age 20 (Figure 6.0)

Table 6.0: Summary of statistics, PA, CV and APE for all species in year 2018 and 2020/2021

Species	No of readers 2018/2020	PA (%) 2018/2020	CV (%) 2018/2020	APE (%) 2018/2020
Black scabbardfish	11 / 13	37 / 38	26 / 23	- / 17

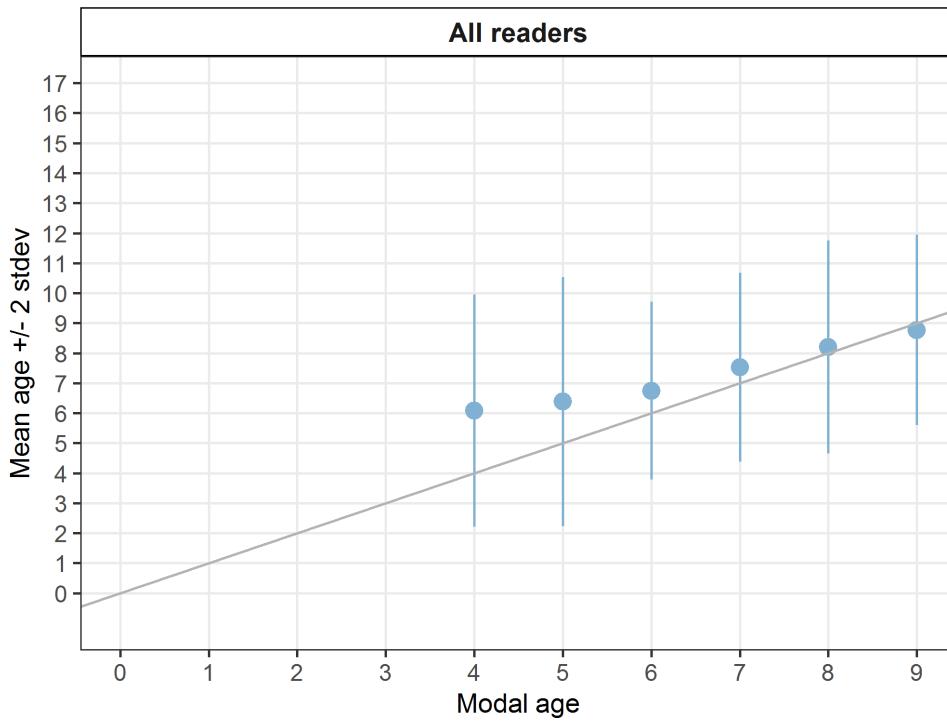

Figure 6.1.1: Age bias plot for all readers. Mean age recorded +/- 2 SD of each reader and all readers combined are plotted against modal age. The estimated mean age corresponds to the modal age if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

The relative bias is the difference between the mean age (per modal age per reader) and modal age. As for the previous tables, a combined bias for all readers and weighted means are calculated and finally (Table 6.1.4 and Figure 6.1.2).

Table 6.1.4: The relative bias per modal age per reader, the relative bias of all readers combined per modal age and a weighted mean of the relative bias per reader.

Advanced readers

For black scabbardfish, all age readers were defined as “advanced readers”, hence the result for the advanced readers equals the previous results (Table 6.1.1-6.1.5 and Figure 6.1.1-6.1.2).

Age error matrices are calculated per area and only based on the age readings of the advanced readers.

Table 6.1.6: Age Error MatixAge Error Matix (AEM) for 27.5.b. The AEM shows the proportional distribution of age readings for each modal age. Age column should sum to one but due to rounding there might be small deviations in some cases. Only advanced readers are used for calculating the AEM.

strata	Modal age	4	5	6	7	8	9

For additional age reading results and otolith growth analysis, please see Annex 10.1.

Internal consistency

Nine of the age readers aging the black scabbardfish otoliths in 2020/2021, also aged them in 2018. The average ages and internal CV for each reader, the age-plot and the box plot for each reader is shown in Table 6.1.10, Figure 6.1.4 and Figure 6.1.5. For black scabbardfish, the internal consistency varies a bit depending on the age reader, with a CV ranging from 8.8% to 34.1%.

Table 6.1.10: Average age in 2018 and 2020 in addition to CV for each age reader.

Age readers	Greece	Iceland	Portugal	Norway1	Norway2	Norway3	Spain	Norway4	Norway5
Average age 2018	8.9	8.4	4.3	7.0	6.9	7.4	7.4	6.1	6.4
Average age 2020	6.2	8.7	6.5	7.8	6.6	9.9	7.5	7.7	6.2
CV	26.7	11.0	34.1	10.6	8.8	28.2	10.3	17.6	14.2

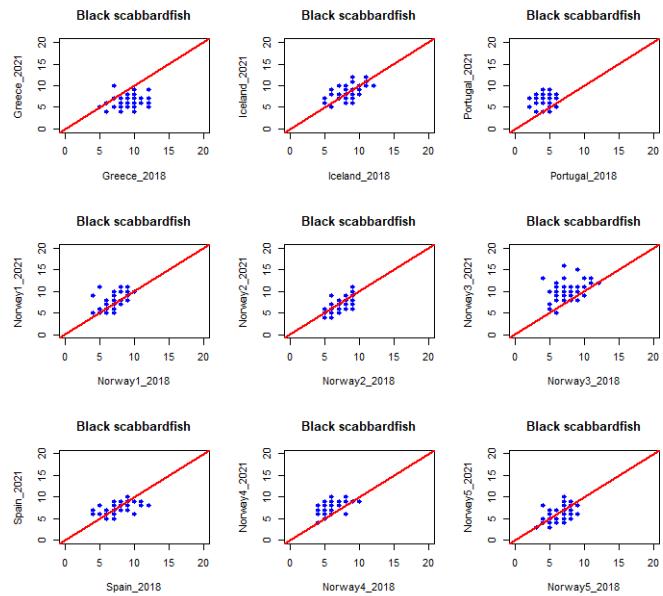

Figure 6.1.4: Age reading in 2018 plotted against age reading in 2020 for each reader.

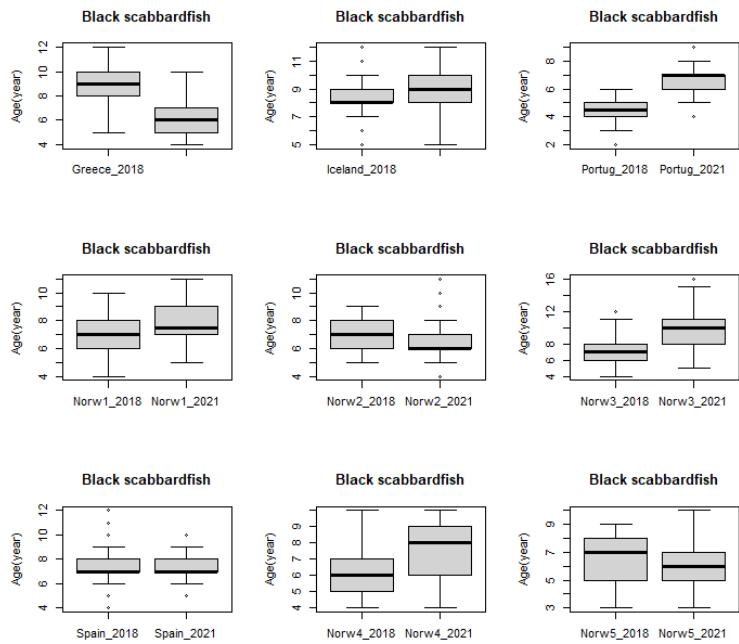

Figure 6.1.5: Age distribution per reader in 2018 and 2020.

6.2 Greater forkbeard

All readers included

The weighted average CV for all readers was 29%, the PA based on modal ages was 55 % and APE was 20 % (Table 6.2.1, Table 6.2.2, Table 6.2.3, and Figure 6.2.1).

Table 6.2.1: Coefficient of Variation (CV) table presents the CV per modal age and reader, the CV of all readers combined per modal age and a weighted mean of the CV per reader. A rank is also assigned to each reader.

Modal age	R03		R04		R05		R06		R07		R08		R11		R12		all
	R01 ES	R02 FR	NO	GR	NO	NO	R07 IS	NO	NO	R10 ES	FO	FO	R13 FR	12 %	29 %		
1	-	83 %	94 %	-	36 %	73 %	37 %	37 %	-	37 %	37 %	37 %	36 %	0 %	61 %

5	0.20	0.00	0.10
Weighted Mean	0.16	0.24	0.20

For additional age reading results and otolith growth analysis, please see Annex 10.2.

Internal consistency

Nine of the age readers aging the greater forkbeard otoliths in 2020/2021, had also aged them in 2018. The average age in both years for each age reader, the internal CV for the reader, the age-plot and the box plot for each reader is shown in Table 6.2.10, Figure 6.2.4 and Figure 6.2.5. For greater forkbeard, the internal consistency had a CV between 11.1% and 22.3%. The average age was quite consistent, with the highest difference in mean age between the two exchanges being one year.

Table 6.2.10: Average age in 2018 and 2020 in addition to CV for each age reader.

Age readers	Greece	Iceland	France	Norway1	Norway2	Norway3	Spain	Norway4	Norway5
Average age 2018	3.0	4.3	2.9	3.6	3.7	3.4	3.8	3.9	3.6
Average age 2020	3.6	3.7	2.9	3.7	4.2	4.1	2.8	3.6	3.6
CV	16.1	13.8	12.9	13.4	19.5	22.3	12.8	11.1	18.7

The Percent Agreement per reader per modal age tells how large part of the readings that are equal to the modal age. The weighted mean including at the bottom of the table is weighted according to number of age readings. A rank is also assigned to each reader.

Table 6.3.2: Percent Agreement (PA) table represents the PA per modal age and reader, the PA of all readers combined per modal age and a weighted mean of the PA per reader. A rank is also assigned to each reader.

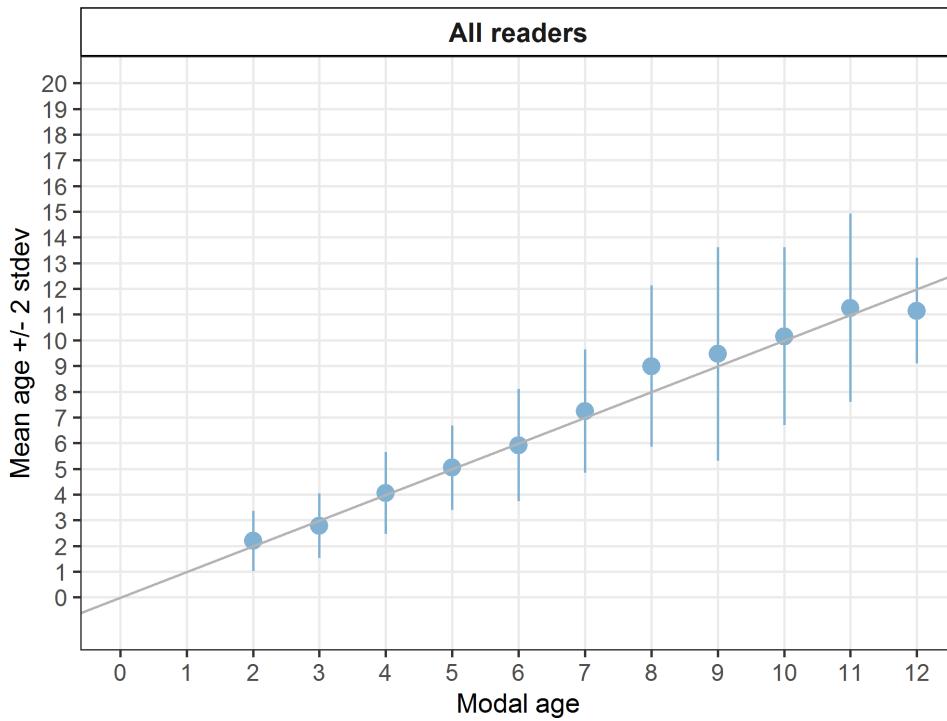

Figure 6.3.1: Age bias plot for all readers. Mean age recorded +/- 2 stdev of each reader and all readers combined are plotted against modal age. The estimated mean age corresponds to modal age if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

The relative bias is the difference between the mean age (per modal age per reader) and modal age. As for the previous tables, a combined bias for all readers and weighted means are calculated and finally (Table 6.3.4 and Figure 6.3.2).

Table 6.3.4: Relative bias table represents the relative bias per modal age per reader, the relative bias of all readers combined per modal age and a weighted mean of the relative bias per reader. A rank is also assigned to each reader.

Advanced readers

For lung, six age readers were defined as “advanced readers”. The weighted average CV is 17% and the PA based on modal ages for all advanced readers is 53% (Table 6.3.6, Table 6.3.7, and Figure 6.3.3).

Table 6.3.6: Coefficient of Variation (CV) table presents the CV per modal age and advanced reader, the CV of all advanced readers combined per modal age and a weighted mean of the CV per reader. A rank is also assigned to each reader.

For additional age reading results and otolith growth analysis, please see Annex 10.3.

Internal consistency

Nine of the age readers aging the ling otoliths in 2020/2021, did also age the same otoliths in 2018. The average age in both years for each age reader, the internal CV for the reader, the age-plot and the box plot for each reader is shown in Table 6.3.10, Figure 6.3.4 and Figure 6.3.5. For ling, the internal consistency varies from 7.1 to 15.9% for eight of the readers, while one reader had a CV of 34.9%. The difference in average age varies from 0.3 years to 2.9 years at the most.

Table 6.3.10: Average age in 2018 and 2020 in addition to CV for each age reader.

Age readers	Greece	Iceland	France	Norway1	Norway2	Norway3	Spain	Norway4	Norway5
Average age 2018	6.6	8.1	6.7	6.4	4.9	8.0	7.0	7.2	7.2
Average age 2020	7.2	6.6	7.2	6.8	7.8	8.5	6.7	6.7	6.9
CV	11.4	15.9	8.4	13.0	34.9	11.2	7.1	11.7	14.0

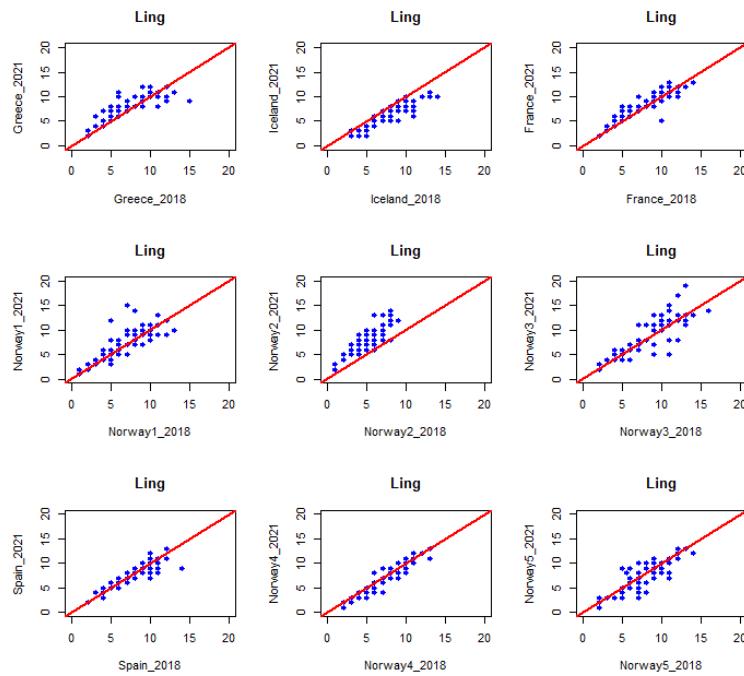

Figure 6.3.4: Age reading in 2018 plotted against age reading in 2020 for each reader.

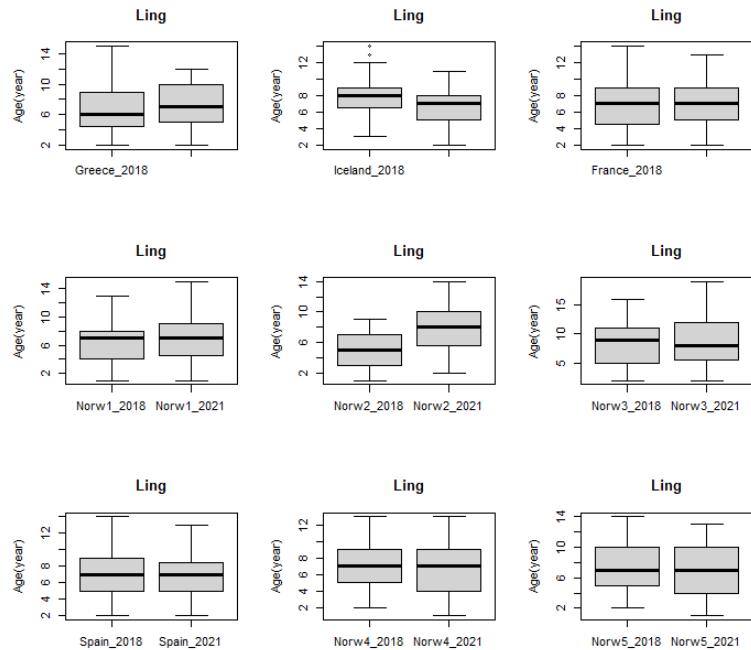

Figure 6.3.5: Boxplot for each age reader for the years 2018 and 2020.

6.4 Blue ling

All readers included

The weighted average CV for all readers is 17%, the PA based on modal ages is 34 % and APE is 13 % (Table 6.4.1, Table 6.4.2, Table 6.4.3, and Figure 6.4.1).

Table 6.4.1: Coefficient of Variation (CV) table presents the CV per modal age and reader, the CV of all readers combined per modal age and a weighted mean of the CV per reader. A rank is also assigned to each reader.

The Percent Agreement per reader per modal age tells how large part of the readings that are equal to the modal age. The weighted mean including at the bottom of the table is weighted according to number of age readings. A rank is also assigned to each reader.

Table 6.4.2: Percent Agreement (PA) table represents the PA per modal age and reader, the PA of all readers combined per modal age and a weighted mean of the PA per reader. A rank is also assigned to each reader.

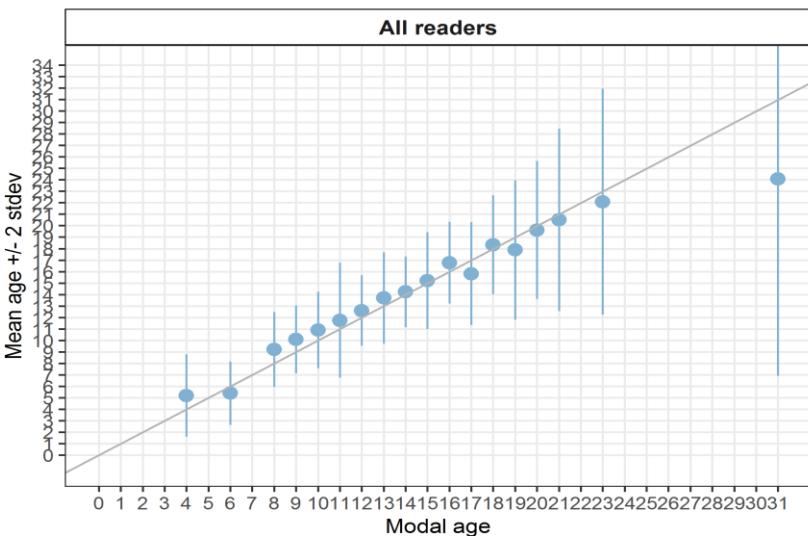

Figure 6.4.1: Age bias plot for all readers. Mean age recorded +/- 2 stdev of each reader and all readers combined are plotted against modal age. The estimated mean age corresponds to modal age if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

The relative bias is the difference between the mean age (per modal age per reader) and modal age. As for the previous tables, a combined bias for all readers and weighted means are calculated and finally (Table 6.4.4 and Figure 6.4.2).

Table 6.4.4: Relative bias table represents the relative bias per modal age per reader, the relative bias of all readers combined per modal age and a weighted mean of the relative bias per reader. A rank is also assigned to each reader.

For additional age reading results and otolith growth analysis, please see Annex 10.4.

Internal consistency

Nine of the age readers aging the blue ling otoliths in 2020/2021, did also age the same otoliths in 2018. The average age in both years for each age reader, the internal CV for the reader, the age-plot and the box plot for each reader is shown in Table 6.4.10, Figure 6.4.4 and Figure 6.4.5. For blue ling, the internal consistency is good, with a CV between 3.8% and 10.5%. However, the average age shows a difference in 1.5 years at the highest, but it is worth noticing that the average age is a lot higher as well then for some of the other species in this exchange.

Table 6.4.10: Average age in 2018 and 2020 in addition to CV for each age reader.

Age readers	Greece	Iceland	France	Norway1	Norway2	Norway3	Spain	Norway4	Norway5
Average age 2018	12.2	12.7	14.0	13.7	15.1	15.0	14.0	13.7	14.5
Average age 2020	10.9	11.2	12.5	14.2	14.3	15.0	13.8	13.4	15.2
CV	10.5	10.3	10.2	6.1	6.4	3.8	6.8	8.2	7.7

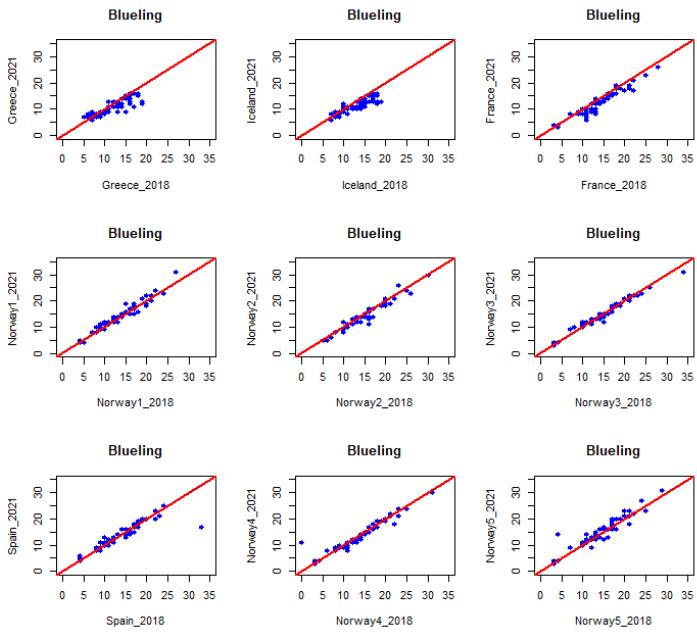

Figure 6.4.4: Age reading in 2018 plotted against age reading in 2020 for each reader.

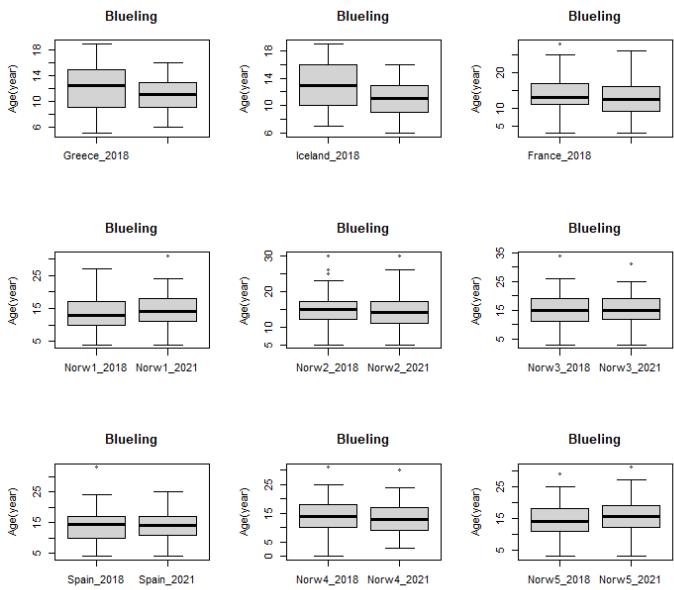

Figure 6.4.5: Boxplot for each age reader for the years 2018 and 2020.

6.5 Greater silver smelt

All readers included

The weighted average CV for all readers is 9%, the PA based on modal ages is 69 % and APE is 6 % (Table 6.5.1, Table 6.5.2, Table 6.5.3, and Figure 6.5.1).

Table 6.5.1: Coefficient of Variation (CV) table presents the CV per modal age and reader, the CV of all readers combined per modal age and a weighted mean of the CV per reader. A rank is also assigned to each reader.

The Percent Agreement per reader per modal age tells how large part of the readings that are equal to the modal age. The weighted mean including at the bottom of the table is weighted according to number of age readings. A rank is also assigned to each reader.

Table 6.5.2: Percent Agreement (PA) table represents the PA per modal age and reader, the PA of all readers combined per modal age and a weighted mean of the PA per reader. A rank is also assigned to each reader.

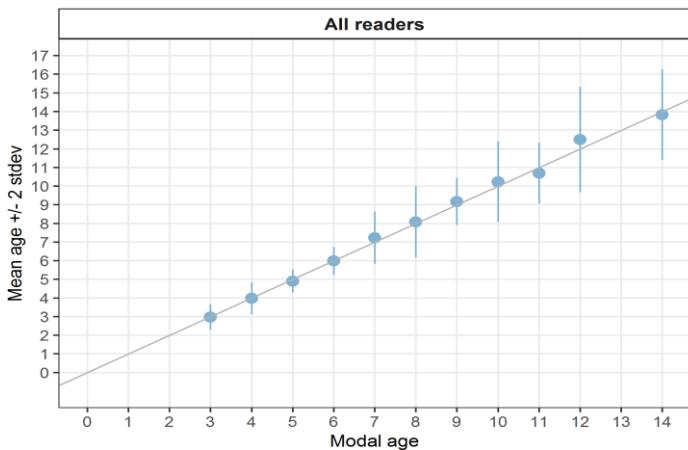

Figure 6.5.1: Age bias plot for all readers. Mean age recorded +/- 2 stdev of each reader and all readers combined are plotted against modal age. The estimated mean age corresponds to modal age if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

The relative bias is the difference between the mean age (per modal age per reader) and modal age. As for the previous tables, a combined bias for all readers and weighted means are calculated and finally (Table 6.5.4 and Figure 6.5.2).

Table 6.5.4: Relative bias table represents the relative bias per modal age per reader, the relative bias of all readers combined per modal age and a weighted mean of the relative bias per reader. A rank is also assigned to each reader.

Advanced readers

For greater silver smelt, three age readers were defined as “advanced readers”. The weighted average CV is 10% and the PA based on modal ages for all advanced readers is 75% (Table 6.5.6, Table 6.5.7, and Figure 6.5.3).

Table 6.5.6: Coefficient of Variation (CV) table presents the CV per modal age and advanced reader, the CV of all advanced readers combined per modal age and a weighted mean of the CV per reader. A rank is also assigned to each reader.

Weighted Mean	0.20	-0.04	0.70	0.29

For additional age reading results and otolith growth analysis, please see Annex 10.5.

Internal consistency

Nine of the age readers aging the greater silver smelt otoliths in 2020/2021, did also age the same otoliths in 2018. The average age in both years for each age reader, the internal CV for the reader, the age-plot and the box plot for each reader is shown in Table 6.5.10, Figure 6.5.4 and Figure 6.5.5. For greater silver smelt, the internal consistency is excellent. The CV only varies from 1.1% to 6.4%. The difference in average age varies only between 0.1 to 0.5 years.

Table 6.5.10: Average age in 2018 and 2020 in addition to CV for each age reader.

Age readers	Greece	Iceland	France	Norway1	Norway2	Norway3	Spain	Norway4	Norway5
Average age 2018	8.3	8.5	8.3	8.4	8.9	8.4	8.6	8.7	8.5
Average age 2020	8.1	8.2	8.8	8.4	8.4	8.5	8.3	8.6	8.5
CV	3.5	3.7	6.4	3.1	4.2	2.1	6.1	1.1	3.3

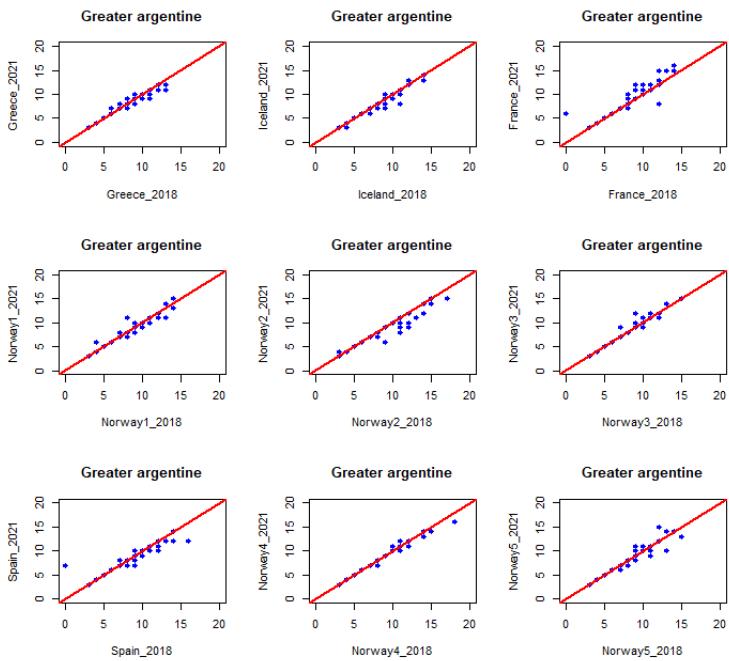

Figure 6.5.4: Age reading in 2018 plotted against age reading in 2020 for each reader.

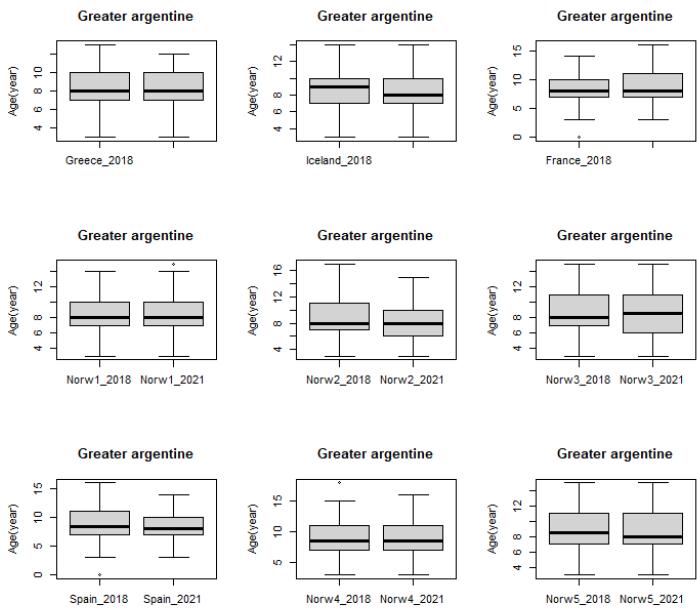

Figure 6.5.5: Boxplot for each age reader for the years 2018 and 2020.

6.6 Tusk

All readers included

The weighted average CV for all readers is 15%, the PA based on modal ages is 44 % and APE is 11 % (Table 6.6.1, Table 6.6.2, Table 6.6.3, and Figure 6.6.1).

Table 6.6.1: Coefficient of Variation (CV) table presents the CV per modal age and reader, the CV of all readers combined per modal age and a weighted mean of the CV per reader. A rank is also assigned to each reader.

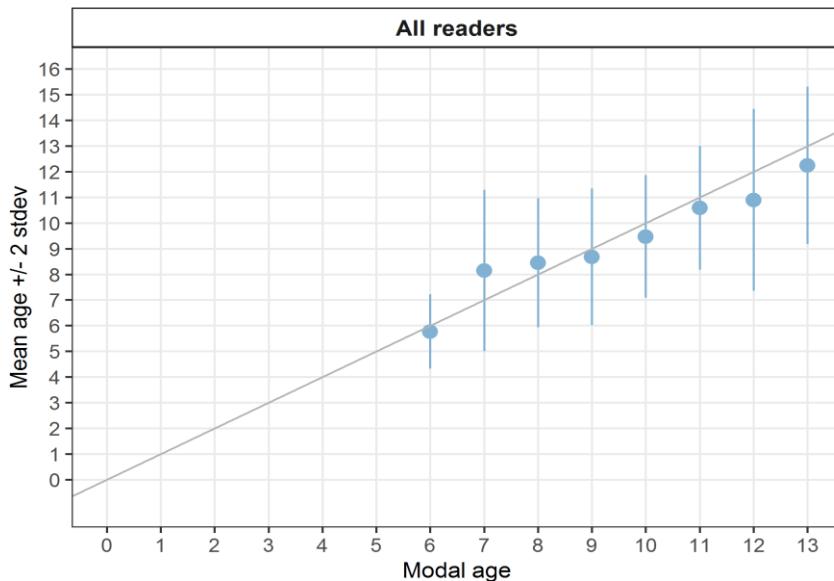

Figure 6.6.1: Age bias plot for all readers. Mean age recorded +/- 2 stdev of each reader and all readers combined are plotted against modal age. The estimated mean age corresponds to modal age if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

The relative bias is the difference between the mean age (per modal age per reader) and modal age. As for the previous tables, a combined bias for all readers and weighted means are calculated and finally (Table 6.6.4 and Figure 6.6.2).

Table 6.6.4: Relative bias table represents the relative bias per modal age per reader, the relative bias of all readers combined per modal age and a weighted mean of the relative bias per reader. A rank is also assigned to each reader.

Weighted Mean	0.24	0.48	1.20	0.64

For additional age reading results and otolith growth analysis, please see Annex 10.6.

Internal consistency

Eight of the age readers aging the tusk otoliths in 2020/2021, did also age the same otoliths in 2018. The average age in both years for each age reader, the internal CV for the reader, the age-plot and the box plot for each reader is shown in Table 6.6.10, Figure 6.6.4 and Figure 6.6.5. For tusk, the internal consistency for six readers was satisfying, with a CV from 5.8% to 7.7%, but two readers had higher CVs. The average age ranged from 7.5 years until 10.5 years.

Table 6.6.10: Average age in 2018 and 2020 in addition to CV for each age reader.

Age readers	Greece	Iceland	France	Norway1	Norway2	Norway3	Norway4	Norway5
Average age 2018	9.9	9.6	9.0	8.9	9.2	10.0	9.2	9.9
Average age 2020	7.5	8.0	8.4	9.0	9.6	10.5	10.0	9.2
CV	20.1	14.0	7.2	7.6	5.8	6.6	7.7	7.0

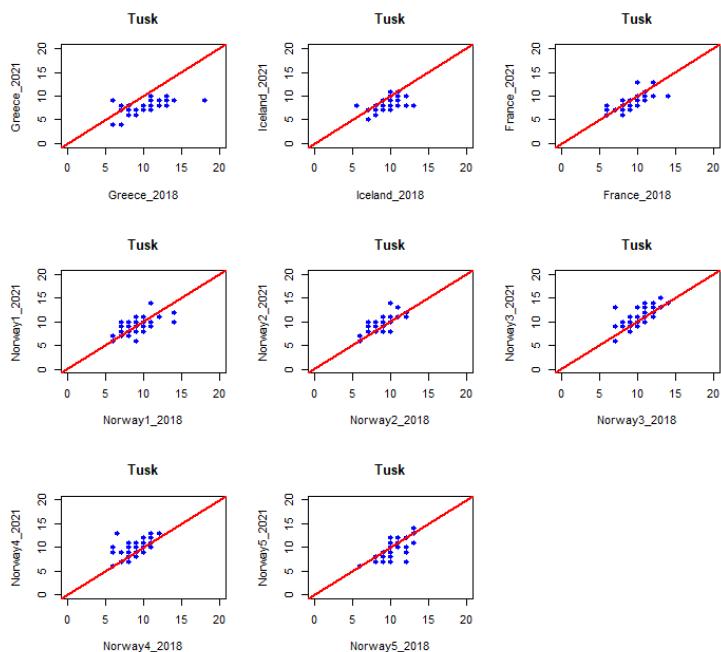

Figure 6.6.4: Age reading in 2018 plotted against age reading in 2020 for each reader.

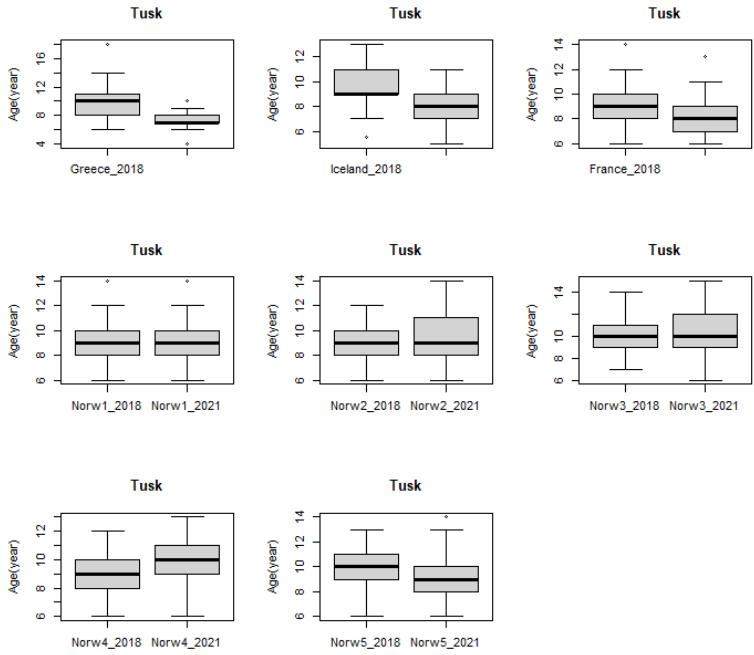

Figure 6.6.5: Boxplot for each age reader for the years 2018 and 2020.

6.7 Blackspot seabream

All readers included

The weighted average CV for all readers is 26%, the PA based on modal ages is 39 % and APE is 19 % (Table 6.7.1, Table 6.7.2, Table 6.7.3, and Figure 6.7.1).

Table 6.7.1: Coefficient of Variation (CV) table presents the CV per modal age and reader, the CV of all readers combined per modal age and a weighted mean of the CV per reader. A rank is also assigned to each reader.

For additional age reading results and otolith growth analysis, please see Annex 10.7.

Internal consistency

Ten of the age readers aging the blackspot seabream otoliths in 2020/2021, did also age the same otoliths in 2018. The average age in both years for each age reader, the internal CV for the reader, the age-plot and the box plot for each reader is shown in Table 6.7.10, Figure 6.7.4 and Figure 6.7.5. For blackspot seabream, the internal consistency varies, depending on the age reader. The lowest CV was 4.5%, and the highest 20.9%. The difference in average age for each reader is from 0.0 years to 1.9 years.

Table 6.7.10: Average age in 2018 and 2020 in addition to CV for each age reader.

Age readers	Greece	Iceland	France	Portugal	Norway1	Norway2	Norway3	Spain	Norway4	Norway5
Average age 2018	5.6	8.5	5.8	4.4	6.2	5.2	5.6	5.6	5.8	5.1
Average age 2020	5.6	6.6	5.4	5.6	6.7	6.5	7.2	6.4	5.1	4.8
CV	4.5	17.9	7.2	20.0	20.2	17.3	20.9	12.7	20.9	15.2

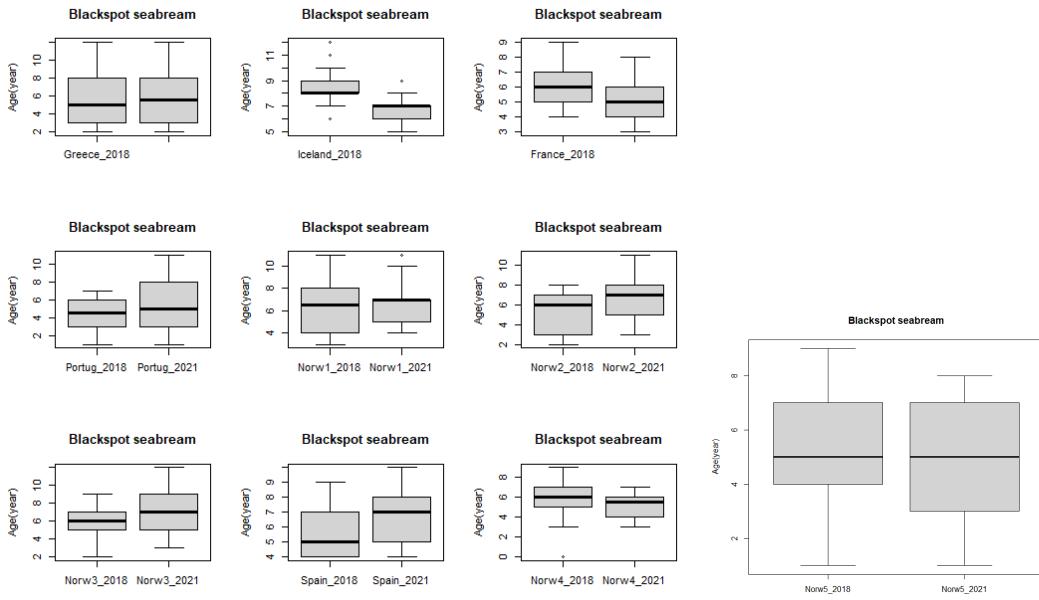

Figure 6.7.5: Boxplot for each age reader for the years 2018 and 2020.

7 Summary

7.1 Black scabbardfish

The results from 2020/2021 showed an improvement from the 2018 exchange. The Coefficient of Variation (CV) in 2020/2021 was 23% versus 26% in 2018. The Percent Agreement (PA) was 38% versus 37%, the Average Percent Error (APE) was 17 % in the 2020/2021 exchange. The CV in 2020/2021 decreased with modal age. The internal consistency varied with a CV between 8.8% and 34.1%.

7.2 Greater forkbeard

For greater forkbeard, the results from 2020/2021 showed an improvement compared to the 2018 exchange. The Coefficient of Variation (CV) in 2020/2021 was 29% versus 34% in 2018. For Percent Agreement (PA) the percentage was the same, 55% in both exchanges. The Average Percent Error (APE) was 20 % in the 2020/2021 exchange. The CV was quite high for modal age 1, but markedly lower for modal age 2 and slightly decreasing thereafter. The internal consistency varied with a CV between 11.1% to 22.3%.

7.3 Ling

The results from the 2020/2021 exchange for ling had improved from 2018. The CV was lower (18% versus 22%) and the PA had increased from 46% in 2018 to 48% in 2020/2021. The Average Percent Error (APE) was 13 % in the 2020/2021 exchange. The CV in 2020/2021 was decreasing with modal age. The internal consistency ranged from a CV of 7.1% to 34.9%.

7.4 Blue ling

In 2020/2021 both the CV and the PA was unchanged from 2018 with values of 17 and 34% respectively, Average Percent Error (APE) was 13 % in the 2020/2021 exchange. The CV in 2020/2021 was highest for the lowest modal ages and quite consistent for the rest. The internal consistency was excellent, with a CV between 3.8% and 10.5%.

7.5 Greater silver smelt

For greater silver smelt, the results from 2020/2021 were equally good as the results from the 2018 exchange. The CV for both years was 9% and the PA was 69%. The Average Percent Error (APE) was 6% in the 2020/2021 exchange. The CV in 2020/2021 was between 6 and 12% for all modal ages. The internal consistency was excellent! The CV varied from 1.1% to 6.4%.

7.6 Tusk

The results from 2020/2021 revealed a decrease in both precision and accuracy compared to the 2018 exchange. The Coefficient of Variation (CV) in 2020/2021 was 15% versus 12% in 2018. The Percent Agreement (PA) was 44% versus 48% and the Average Percent Error (APE) was 11 % in the 2020/2021 exchange. The CV in 2020/2021 was similar for all modal ages. The internal consistency varied with a CV ranging from 5.8% to 20.1%.

7.7 Blackspot seabream

For blackspot seabream, the results from 2020/2021 showed an improvement compared to the 2018 exchange. The Coefficient of Variation (CV) in 2020/2021 was 26% versus 31% in 2018. The Percent Agreement (PA) was 39% and 35%, respectively. The Average Percent Error (APE) was 19% in the 2020/2021 exchange. The CV in 2020/2021 decreased with modal age. The internal consistency varied with a CV between 4.5% and 20.9%.

8 Conclusion

Overall, the results from the deep-water species otolith exchange were good. For six out of seven species in this exchange, the Coefficient of Variation (CV) was improved or unchanged from the previous exchange. Considering that in 2018, some otoliths from each species were discussed and aged in plenary during the workshop prior to individual ageing, the results from the 2020/2021 exchange were good. During the exchange in 2020/2021, no plenary was conducted before the age readers started the exchange, nor did the age readers discuss the images and annotations. The only available help the age readers had access to, were the species-specific age reading manuals reviewed and agreed upon during the 2018 workshop.

According to the agreement of WKAMDEEP2 in 2018, a new workshop should be planned for 2023, with two exchanges in between using the otolith images prepared in 2018, to assess potential drifting of the age readers. If an exchange is to be implemented, it might be a good idea to invite all the age readers of deep-water species to a discussion and a review of the age reading of each species prior to the exchange. However, the images are not of the best quality, and it has been questioned whether a second exchange using the same material would be useful or necessary regarding improvement of age reading. Instead, a new workshop should be planned, where the age readers can discuss and execute age readings using physical otoliths and new sets of images.

Continued age reading workshops and otolith exchanges of these deep-water species are important for many reasons. Many of the species have only one or a few readers, hence ICES workshops and exchanges provide a platform for discussion, continuity, and maintenance of expertise. Many of these species are considered to be data-poor or data-limited, thus any age data available is of great value and is currently used indirectly to monitor trends in stock assessments. If a species is re-categorized or new assessment models require age data, reliable age data over a time period would be beneficial. For some stocks of ling, greater silver smelt and tusk, age data are used directly in assessment models.

Based on the conclusion and considerations regarding this group of deep-water species, we highly recommend that a new workshop should be arranged within 2 years (2024-2025).

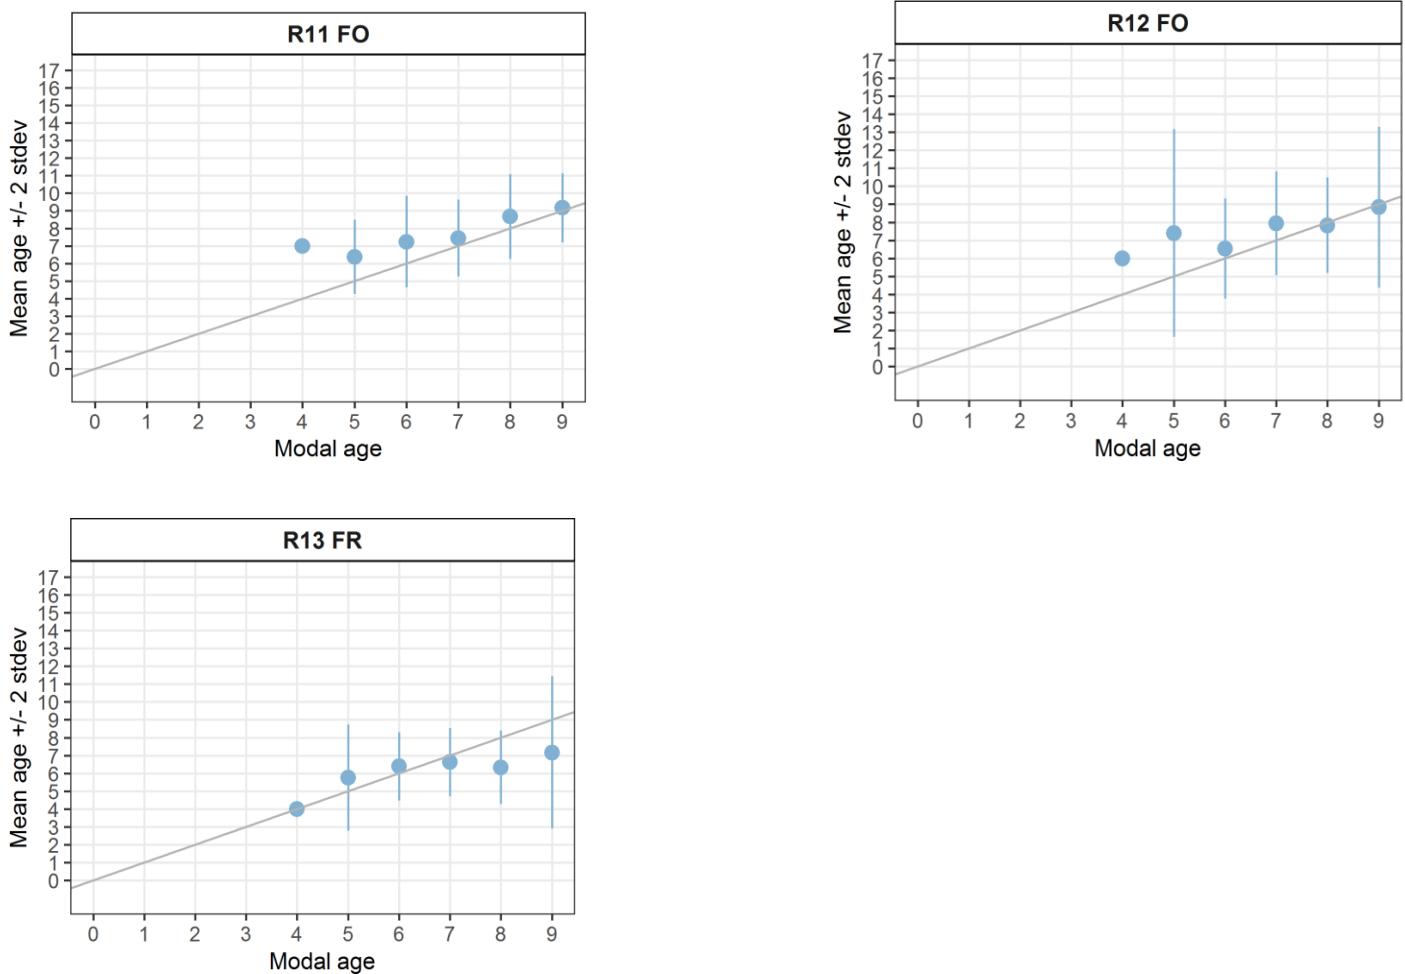

Figure 10.1.1: Age bias plot for each reader. Mean age recorded ± 2 stdev of each reader are plotted against modal age. The estimated mean age corresponds to modal age if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

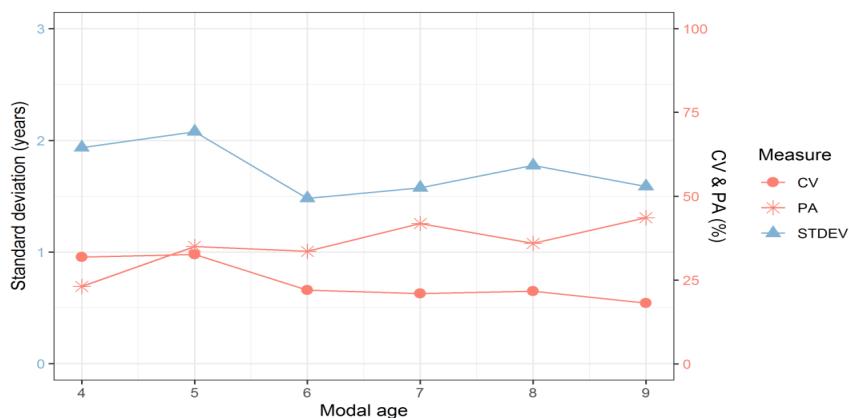

Figure 10.1.2: CV, PA and (STDEV (standard deviation) are plotted against modal age.

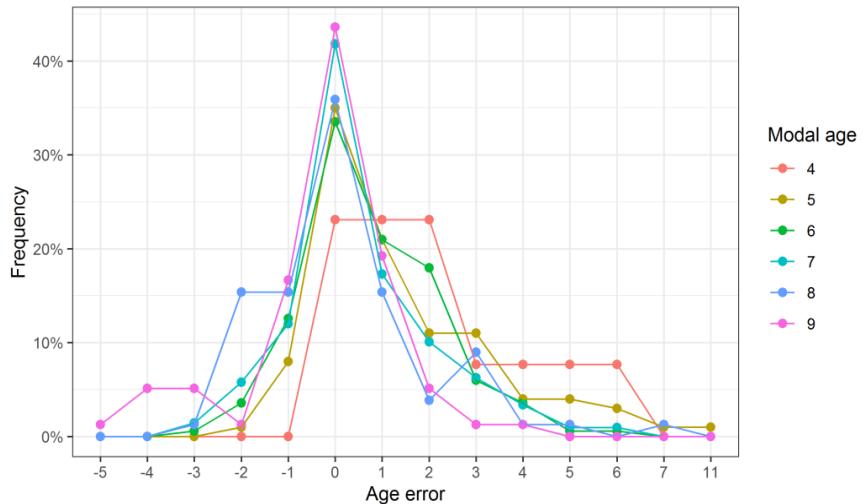

Figure 10.1.3: The distribution of the age reading errors in percentage by modal age as observed from the whole group of age readers in an age reading comparison to modal age. The achieved precision in age reading by MODAL age group is shown by the spread of the age readings errors. There appears to be no relative bias if the age reading errors are normally distributed. The distributions are skewed if relative bias occurs.

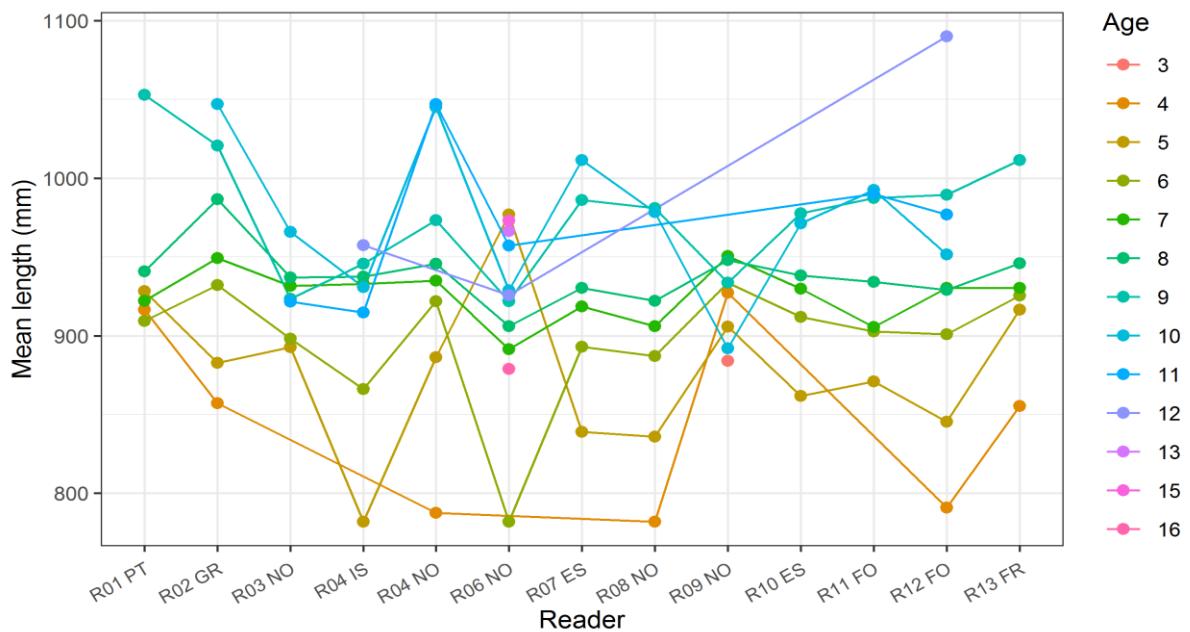

Figure 10.1.4: The mean length at age as estimated by each age reader.

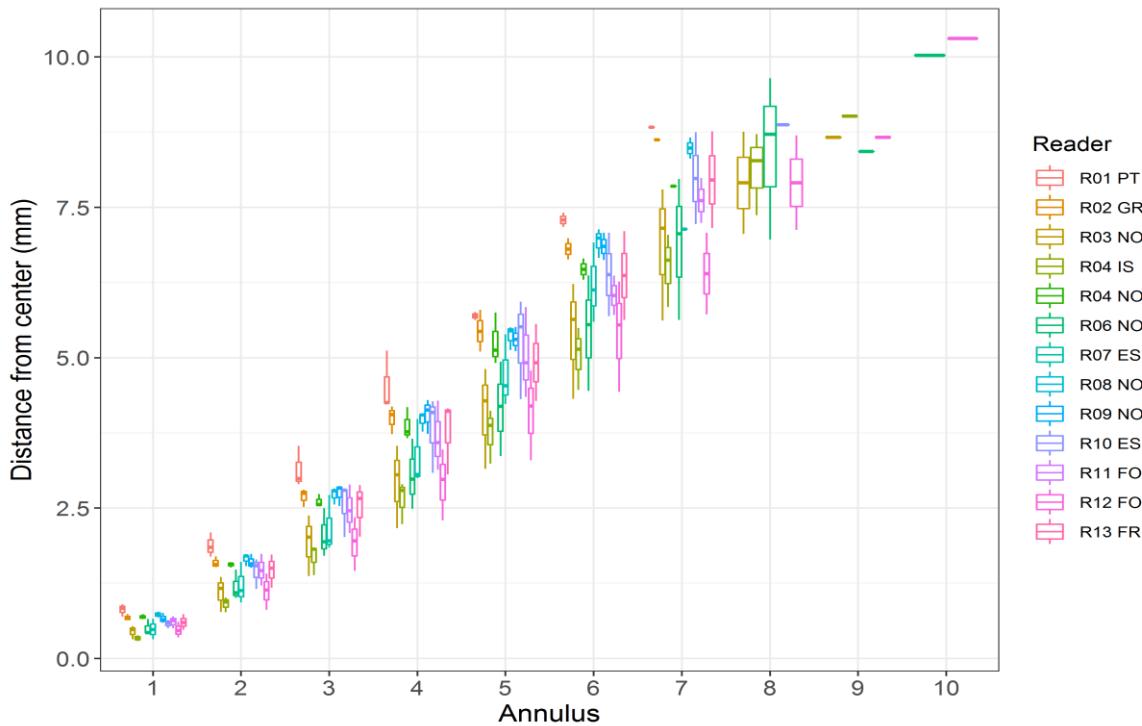

Figure 10.1.5: Plot of average distance from the centre to the winter rings for all readers by preparation method. The boxes represent the median, upper and lower box boundaries of the interquartile range, whiskers represent the minimum and maximum values, and the dots represent the outliers.

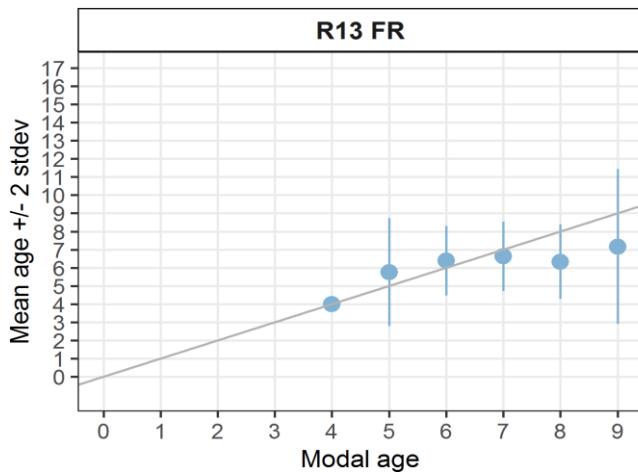

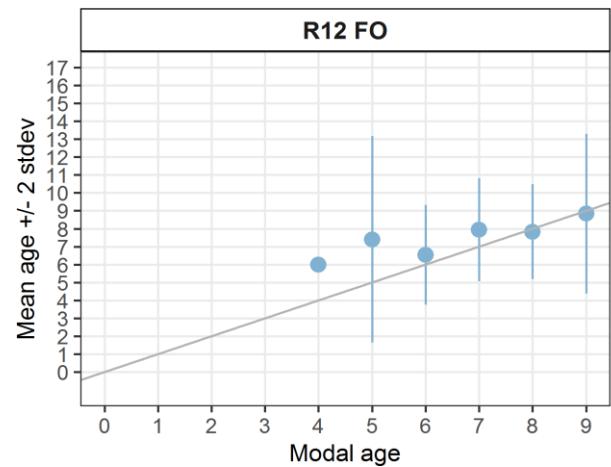

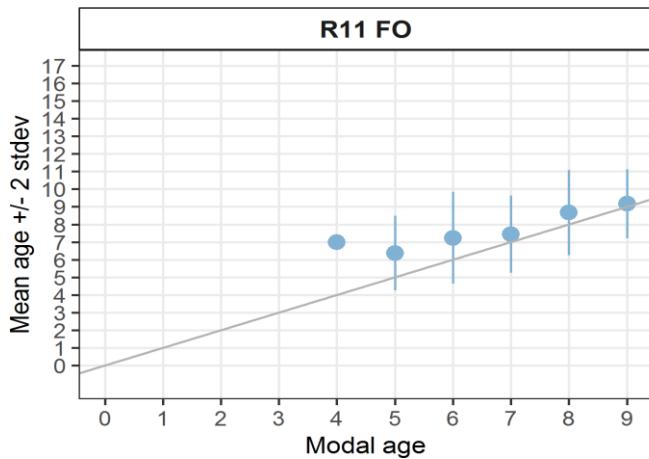

Figure 10.1.6: Age bias plot for advanced readers. Mean age recorded ± 2 stdev of each reader are plotted against modal age. The estimated mean age corresponds to modal age if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

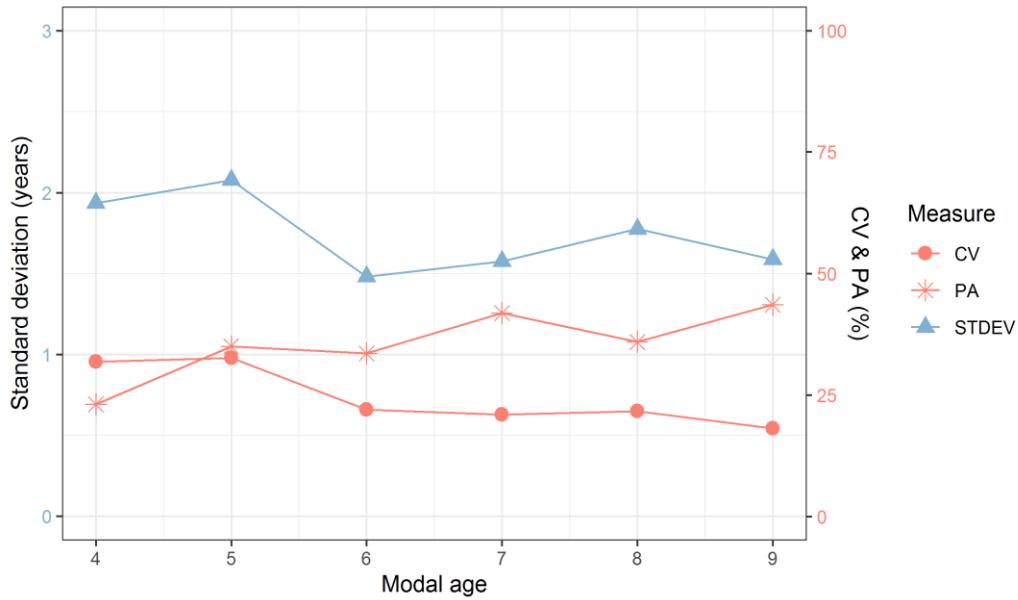

Figure 10.1.7: CV, PA and (STDEV (standard deviation) are plotted against modal age.

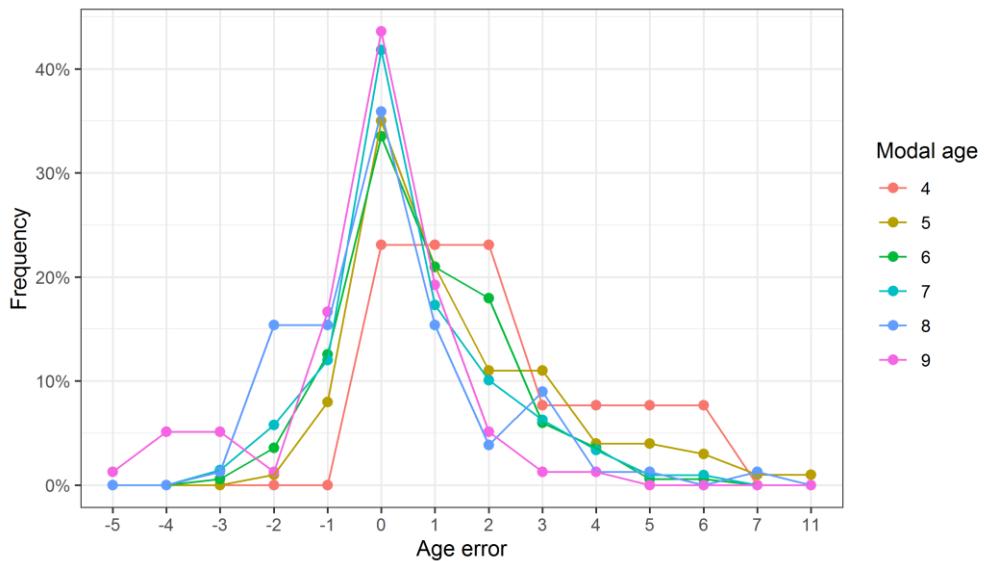

Figure 10.1.8: The distribution of the age reading errors in percentage by modal age as observed from the whole group of age readers in an age reading comparison to modal age. The achieved precision in age reading by MODAL age group is shown by the spread of the age readings errors. There appears to be no relative bias if the age reading errors are normally distributed. The distributions are skewed if relative bias occurs.

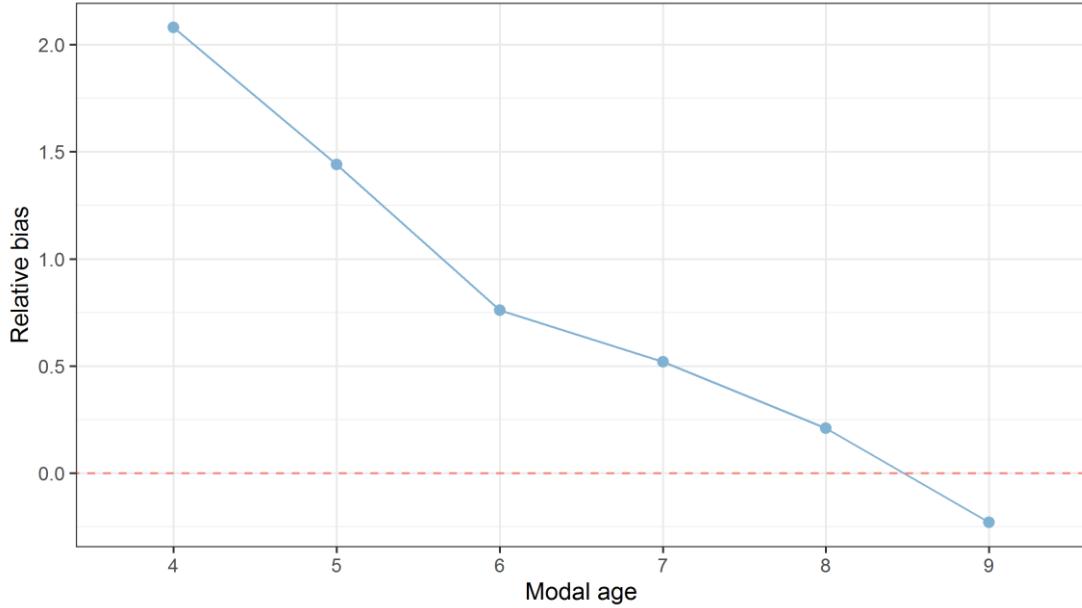

Figure 10.1.9: The relative bias by modal age as estimated by all age readers combined.

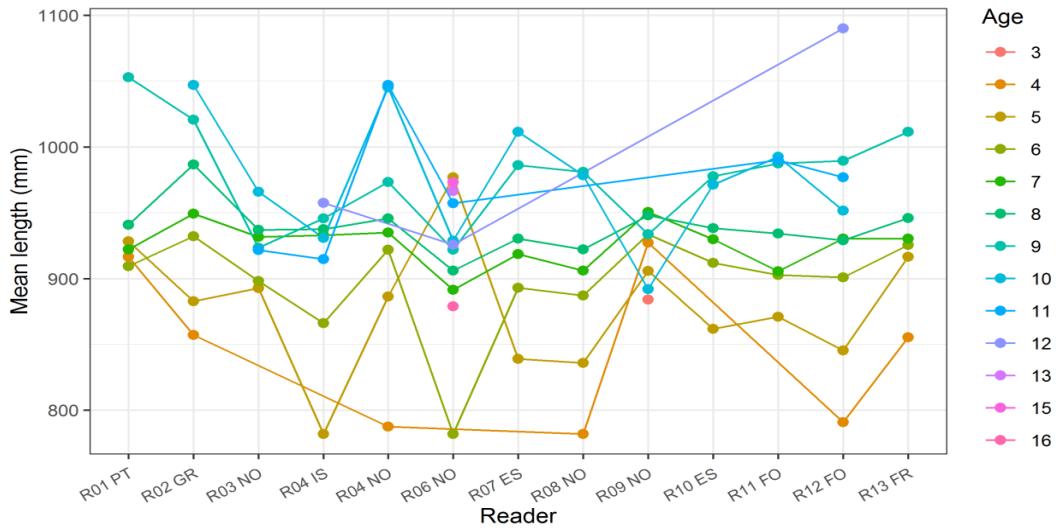

Figure 10.1.10: The mean length at age as estimated by each age reader.

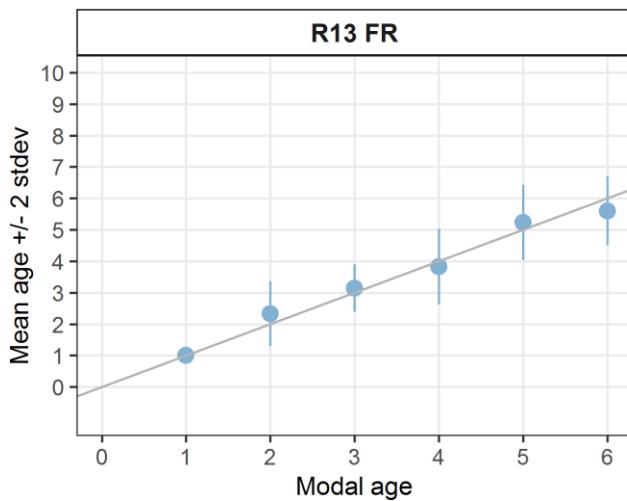

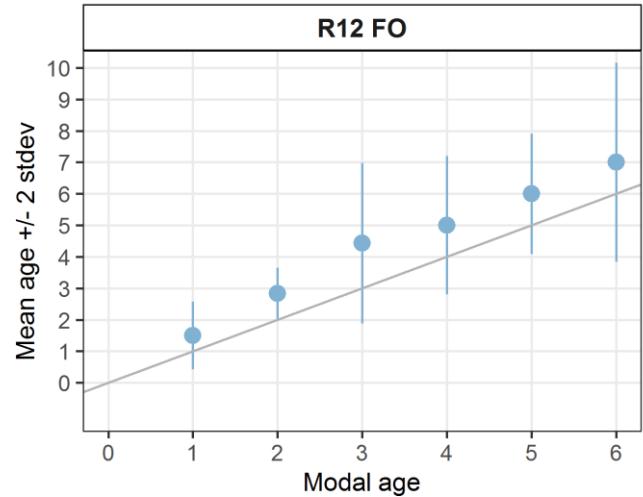

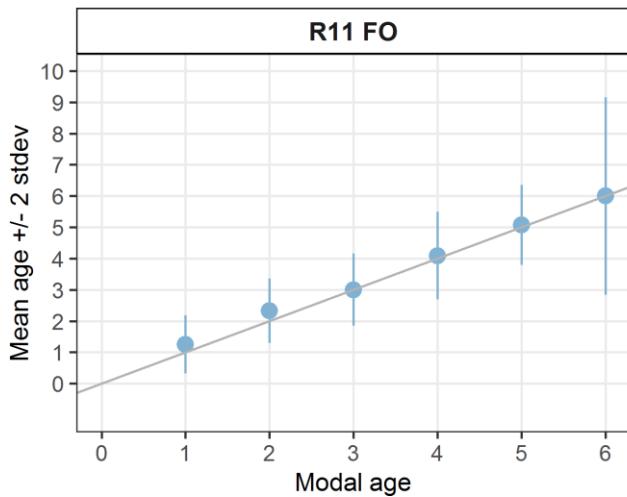

Figure 10.2.1: Age bias plot for all readers. Mean age recorded +/- 2 stdev of each reader are plotted against modal age. The estimated mean age corresponds to modal age if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

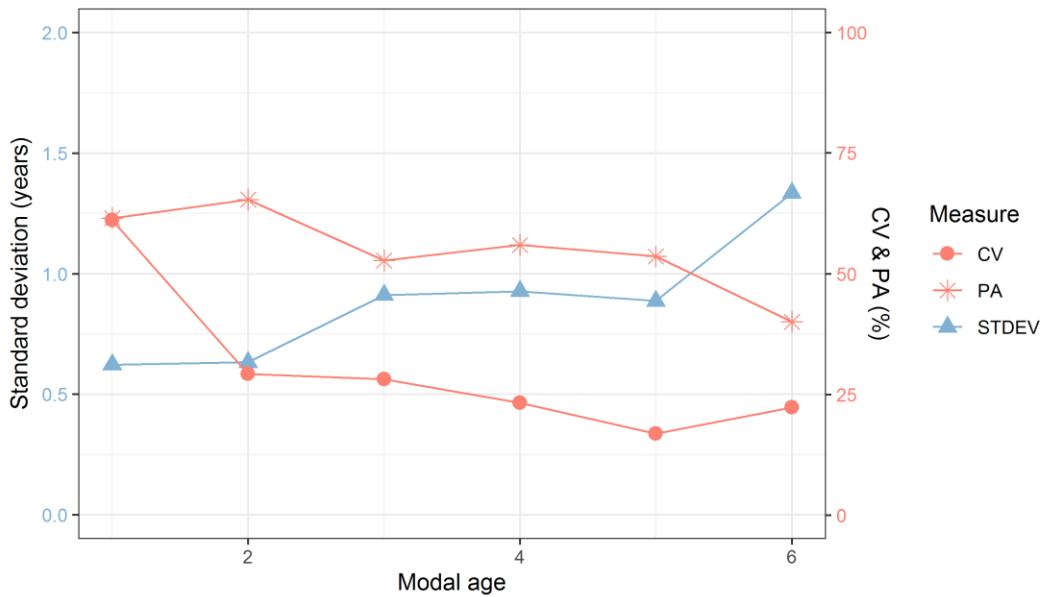

Figure 10.2.2: CV, PA and (STDEV (standard deviation) are plotted against modal age.

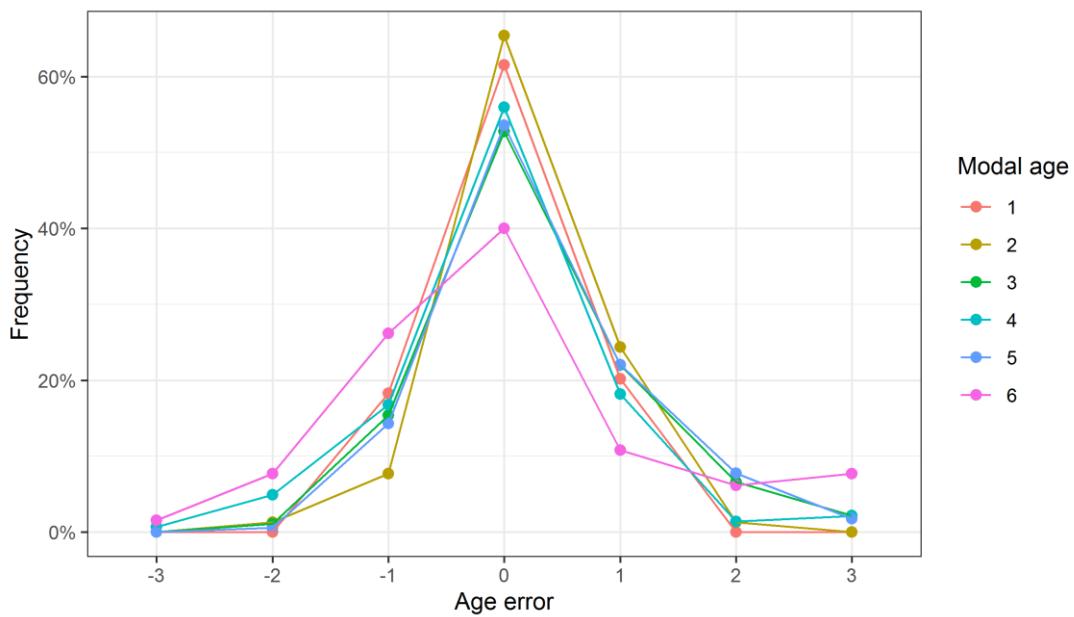

Figure 10.2.3: The distribution of the age reading errors in percentage by modal age as observed from the whole group of age readers in an age reading comparison to modal age. The achieved precision in age reading by MODAL age group is shown by the spread of the age readings errors. There appears to be no relative bias if the age reading errors are normally distributed. The distributions are skewed if relative bias occurs.

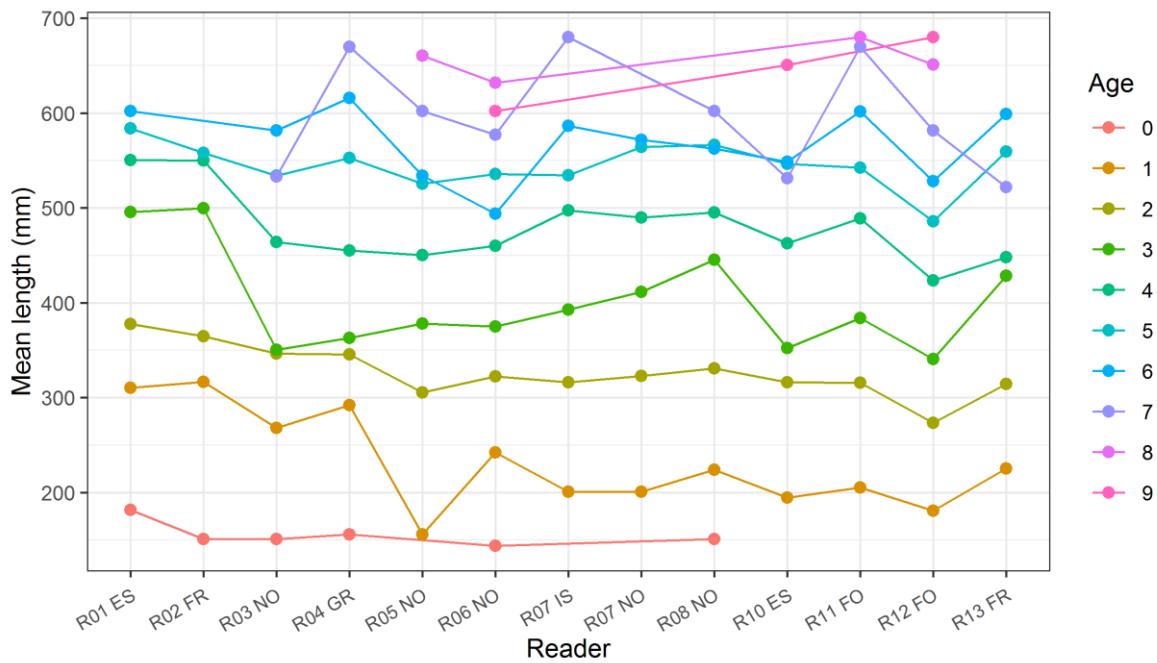

Figure 10.2.4: The mean length at age as estimated by each age reader.

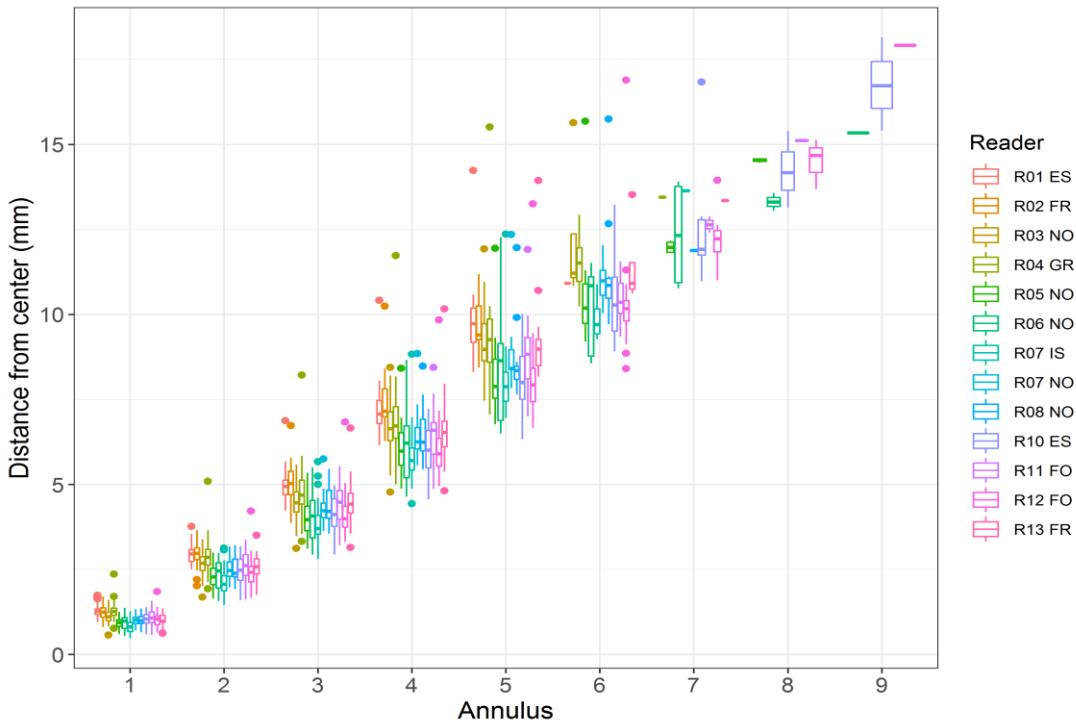

Figure 10.2.5: Plot of average distance from the centre to the winter rings for all readers by preparation method. The boxes represent the median, upper and lower box boundaries of the interquartile range, whiskers represent the minimum and maximum values, and the dots represent the outliers.

Table 10.2.6: Number of age readings table gives an overview of number of readings per reader and modal age. The total numbers of readings per reader and per modal age are summarized at the end of the table.

Modal age	R01 ES	R02 FR	total
0	5	5	10
1	9	9	18
2	9	9	18
3	9	9	18
4	13	13	26
5	5	5	10
Total	50	50	100

Table 10.2.7: Age composition by reader gives a summary of number of readings per reader.

Modal age	R01 ES	R02 FR
0	5	3
1	8	7
2	8	12
3	10	8
4	11	12
5	7	8
6	1	0
Total	50	50

Table 10.2.8: Mean length at age per reader is calculated per reader and age (not modal age) and for all readers combined per age. A weighted mean is also given.

Age	R01 ES	R02 FR
0	182 mm	151 mm
1	310 mm	317 mm
2	378 mm	365 mm
3	496 mm	500 mm
4	550 mm	550 mm
5	584 mm	558 mm
6	602 mm	-
Weighted Mean	442 mm	442 mm

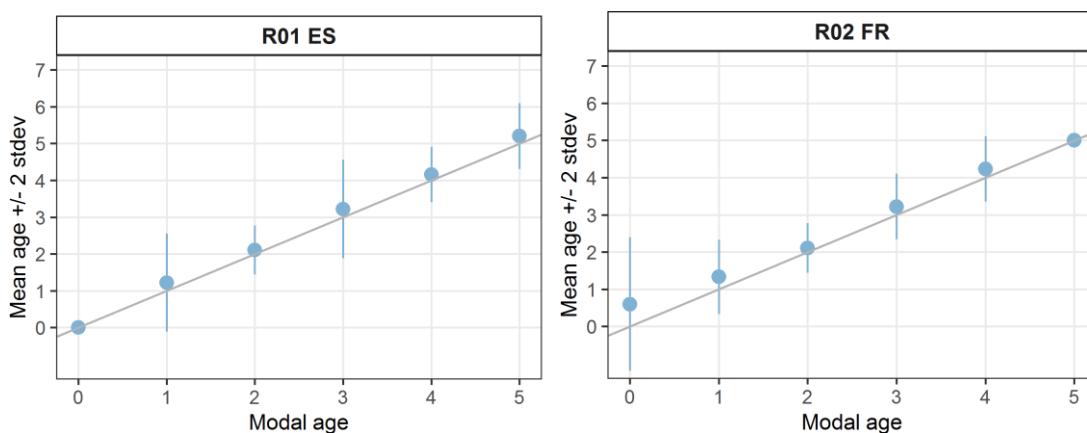

Figure 10.2.6: Age bias plot for advanced readers. Mean age recorded +/- 2 stdev of each reader are plotted against modal age. The estimated mean age corresponds to modal age if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

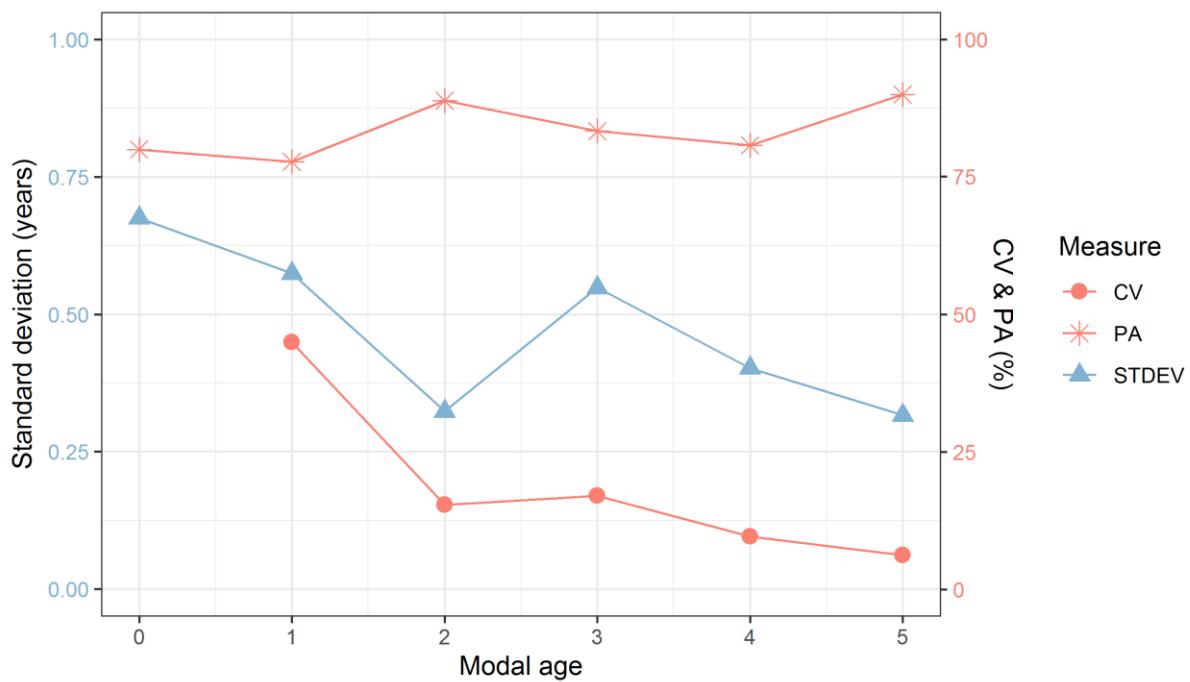

Figure 10.2.7: CV, PA and (STDEV (standard deviation) are plotted against modal age.

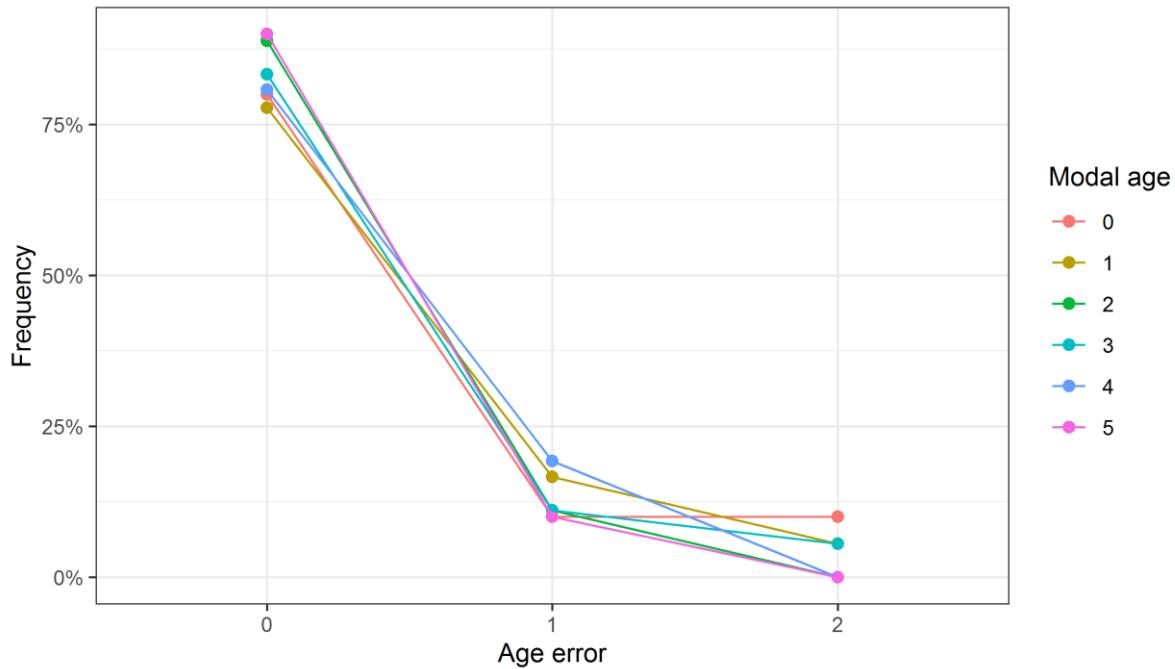

Figure 10.2.8: The distribution of the age reading errors in percentage by modal age as observed from the whole group of age readers in an age reading comparison to modal age. The achieved precision in age reading by MODAL age group is shown by the spread of the age readings errors. There appears to be no relative bias if the age reading errors are normally distributed. The distributions are skewed if relative bias occurs.

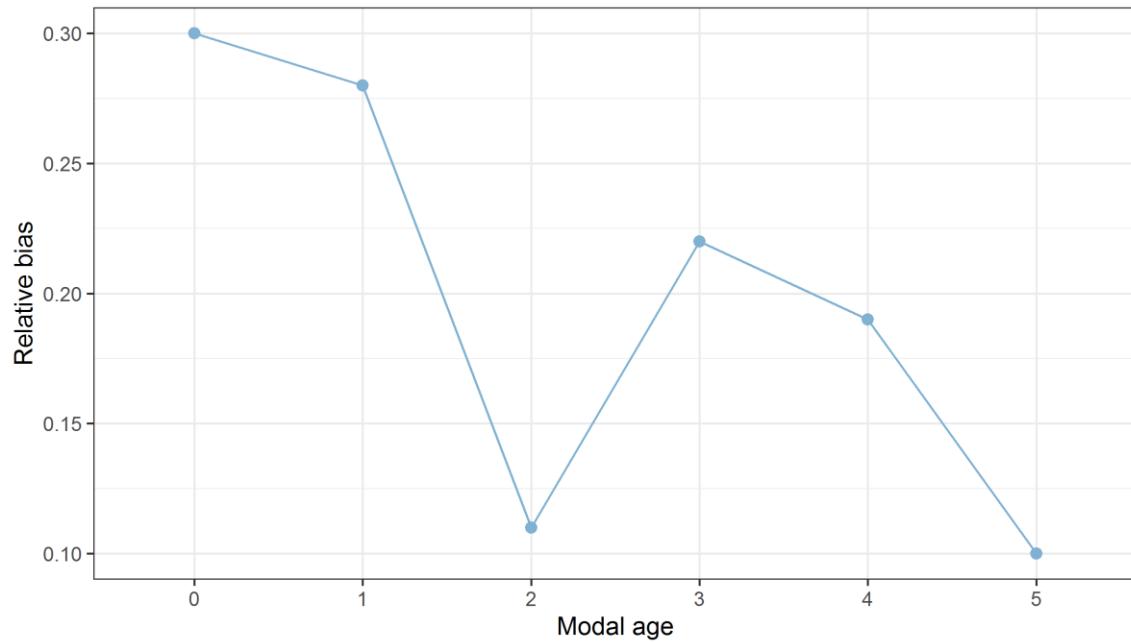

Figure 10.2.9: The relative bias by modal age as estimated by all age readers combined.

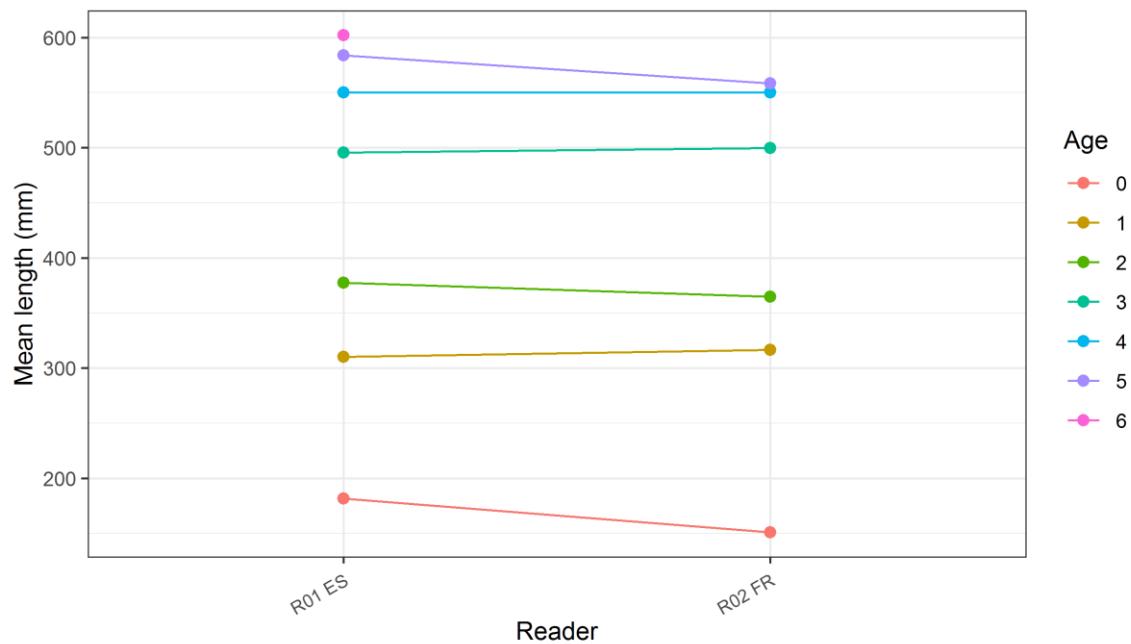

Figure 10.2.10: The mean length at age as estimated by each age reader.

10.3 Results listing

All readers

Data Overview

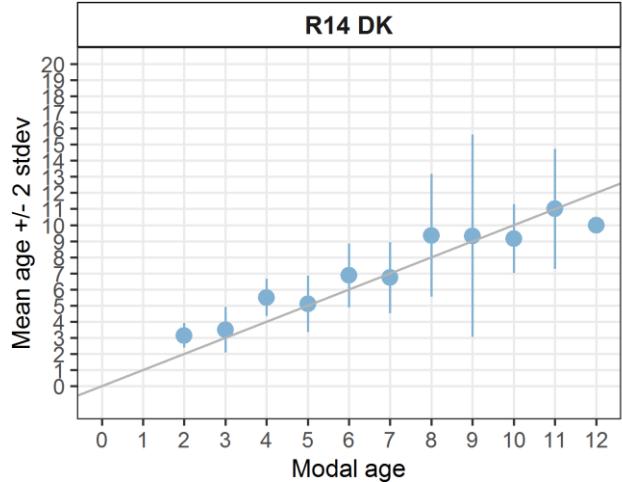

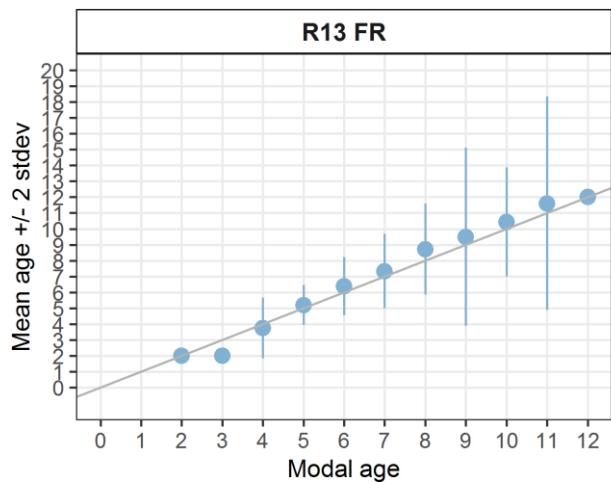

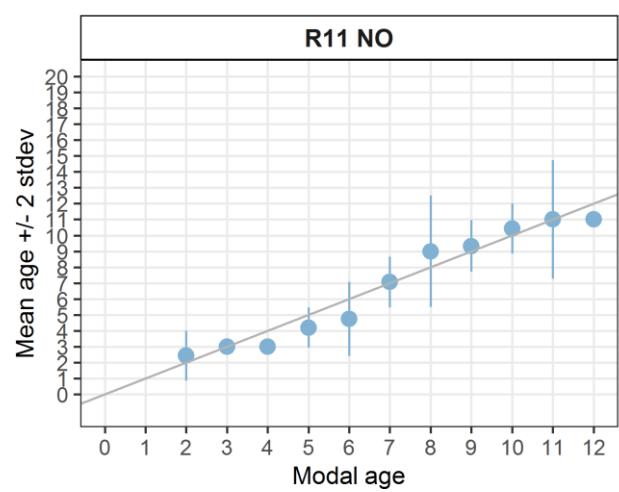

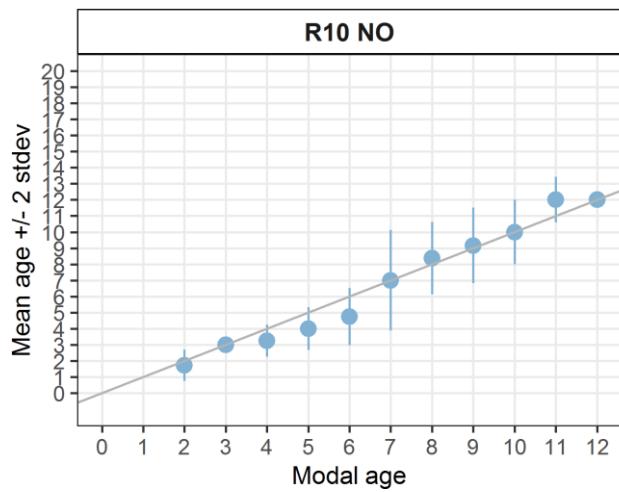

Figure 10.3.1: Age bias plot for all readers. Mean age recorded +/- 2 stdev of each reader are plotted against modal age. The estimated mean age corresponds to modal age if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

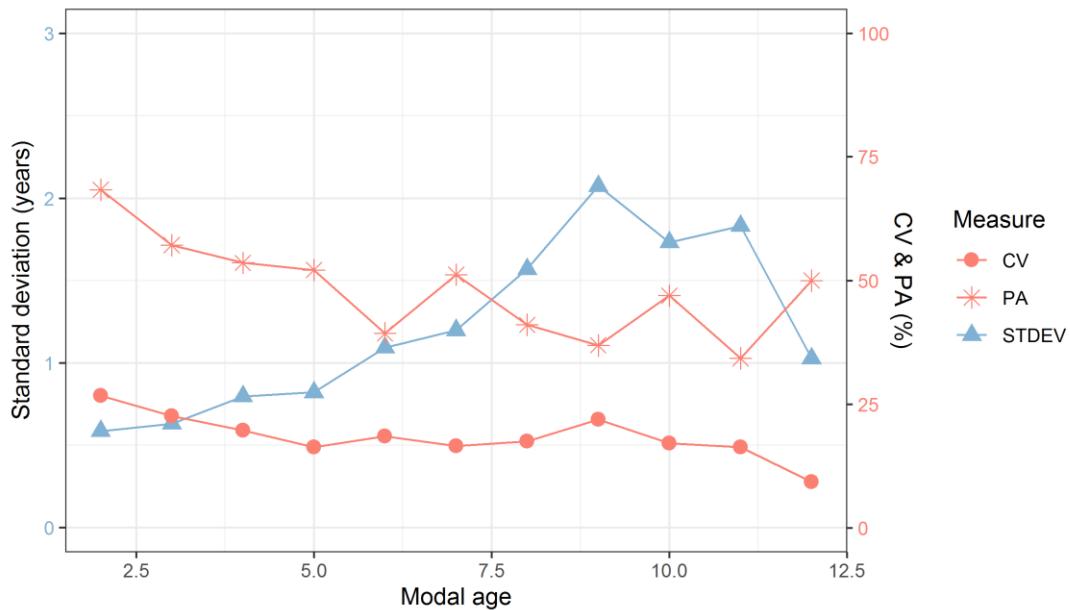

Figure 10.3.2: CV, PA and (STDEV (standard deviation) are plotted against modal age.

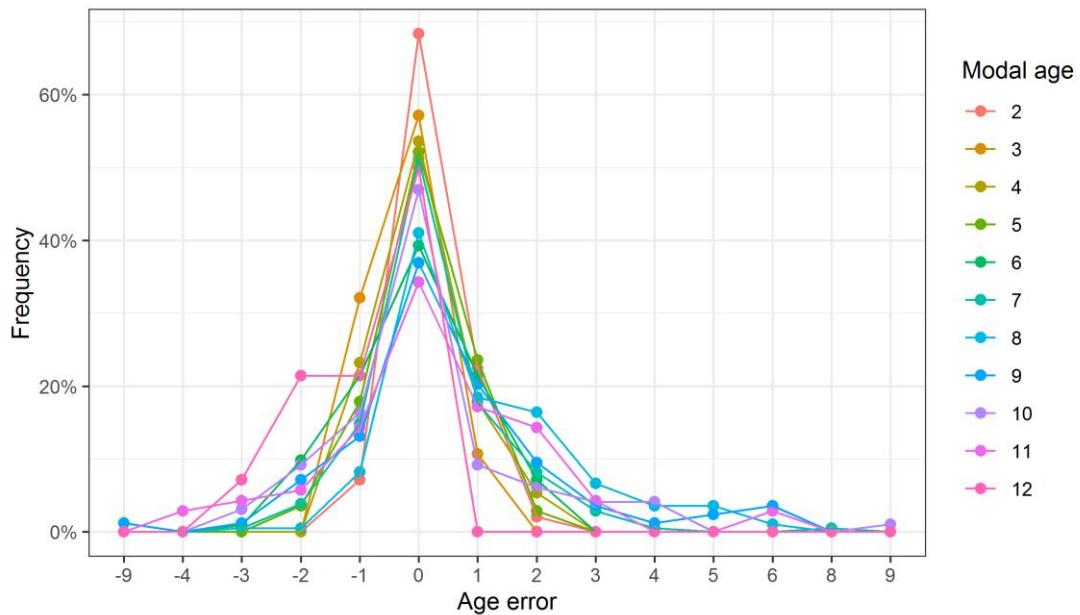

Figure 10.3.3: The distribution of the age reading errors in percentage by modal age group of age readers in an age reading comparison to modal age. The achieved precision in age reading by MODAL age group is shown by the spread of the age readings errors. There appears to be no relative bias if the age reading errors are normally distributed. The distributions are skewed if relative bias occurs.

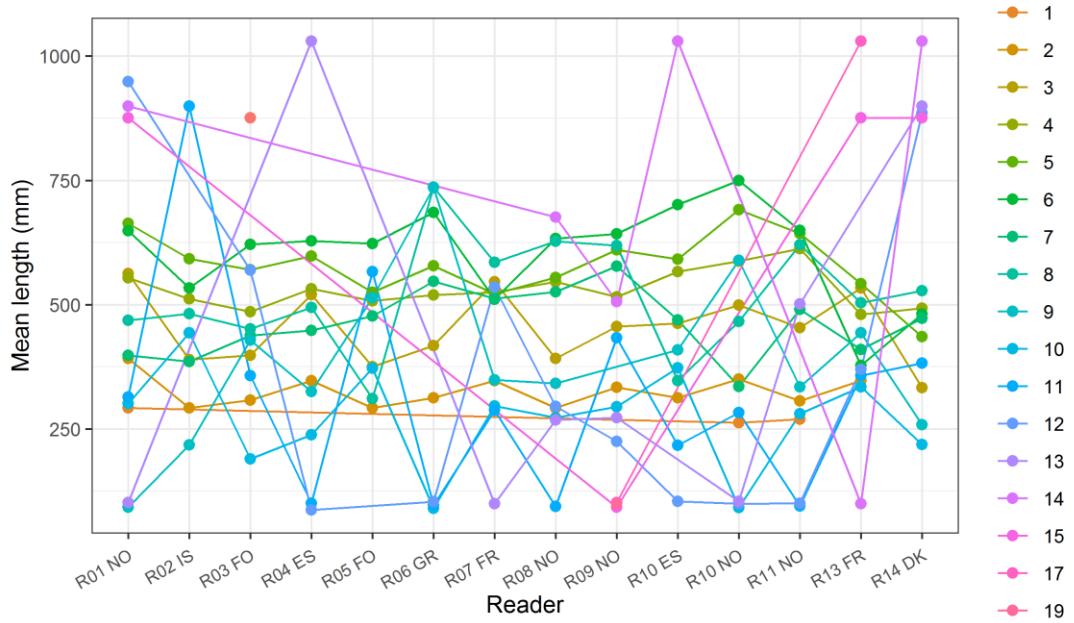

Figure 10.3.4: The mean length at age as estimated by each age reader.

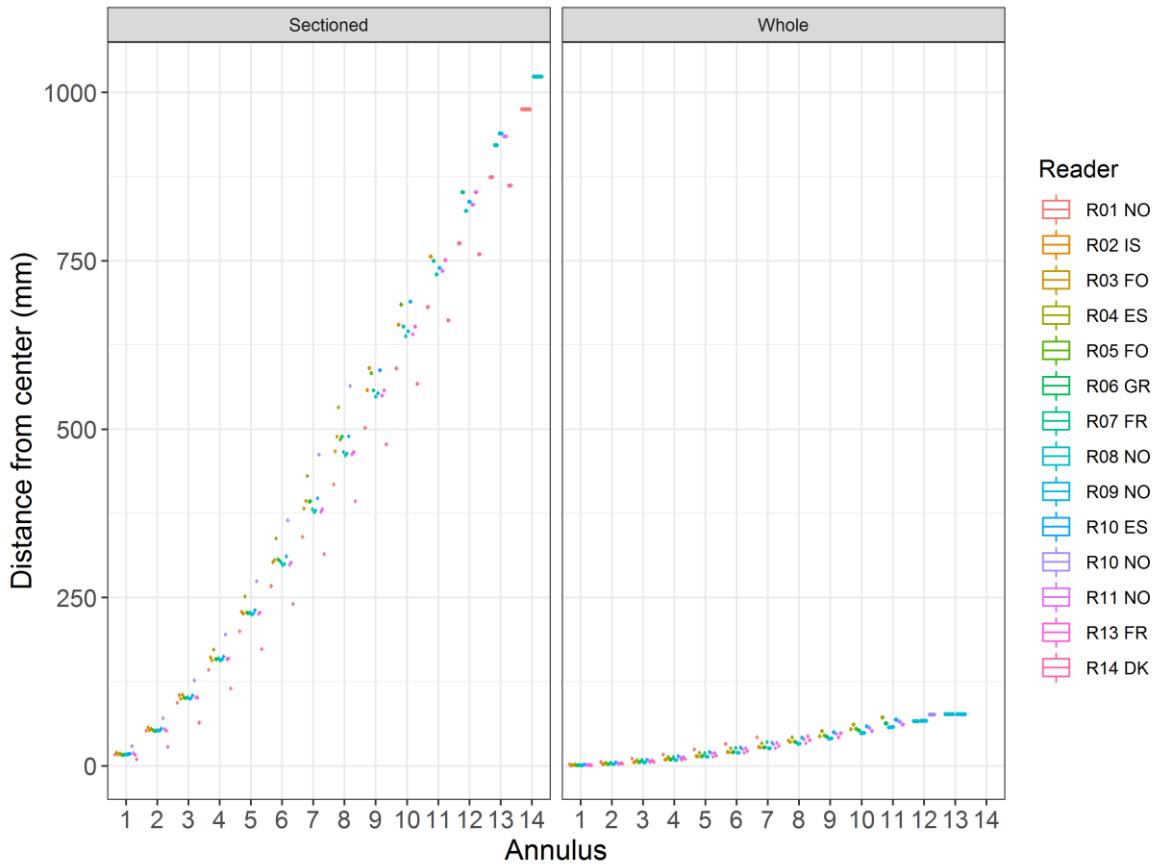

Figure 10.3.5: Plot of average distance from the centre to the winter rings for advanced readers by preparation method. The boxes represent the median, upper and lower box boundaries of the interquartile range, whiskers represent the minimum and maximum values, and the dots represent the outliers.

Advanced readers

All samples included

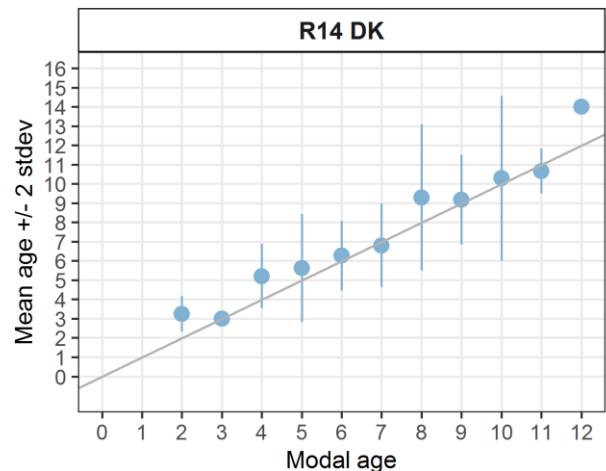

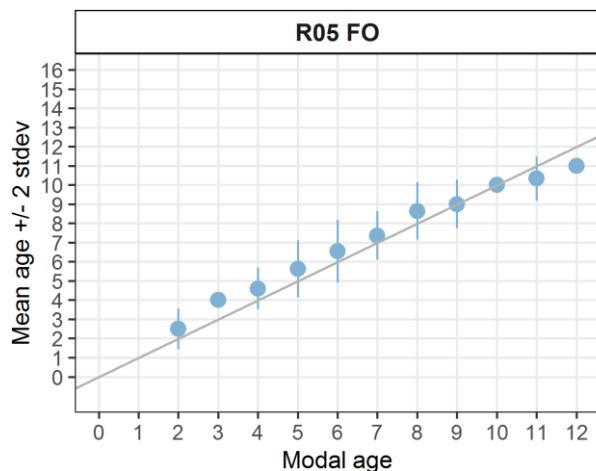

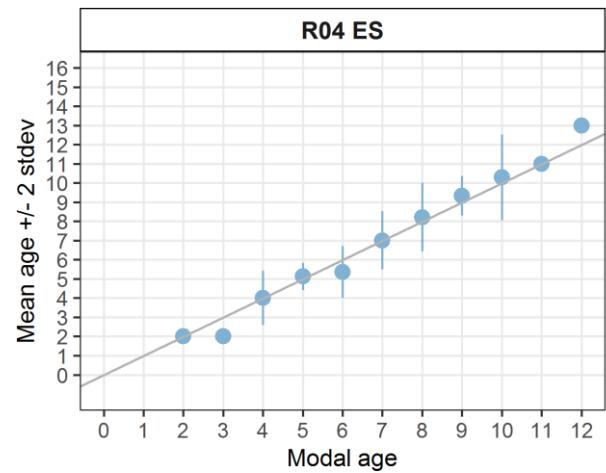

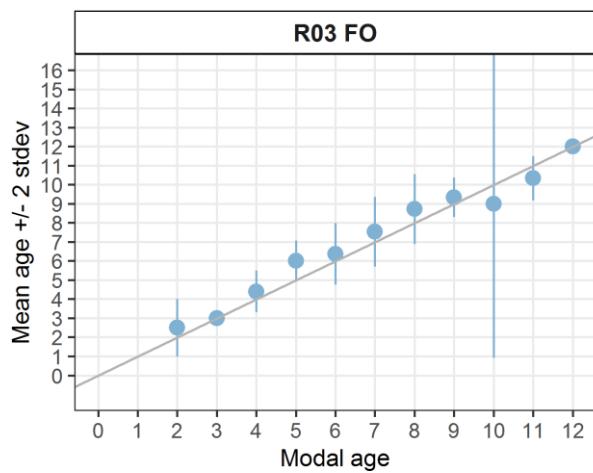

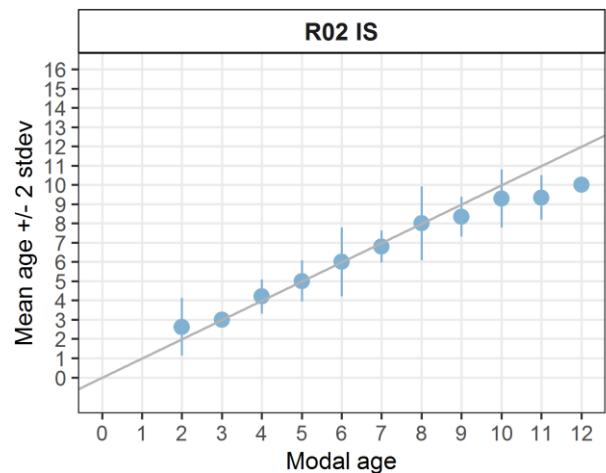

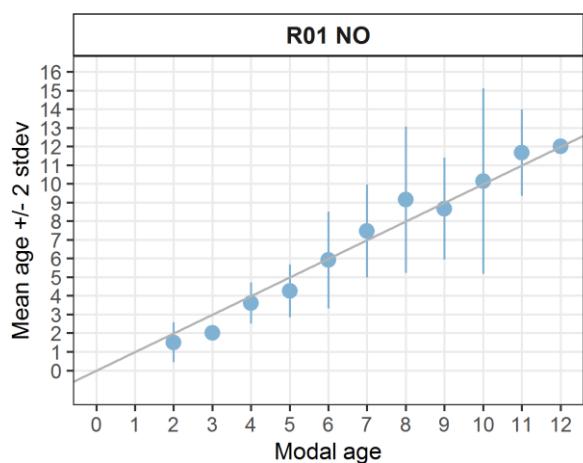

Figure 10.3.6: Age bias plot for advanced readers. Mean age recorded +/- 2 stdev of each reader are plotted against modal age. The estimated mean age corresponds to modal age if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

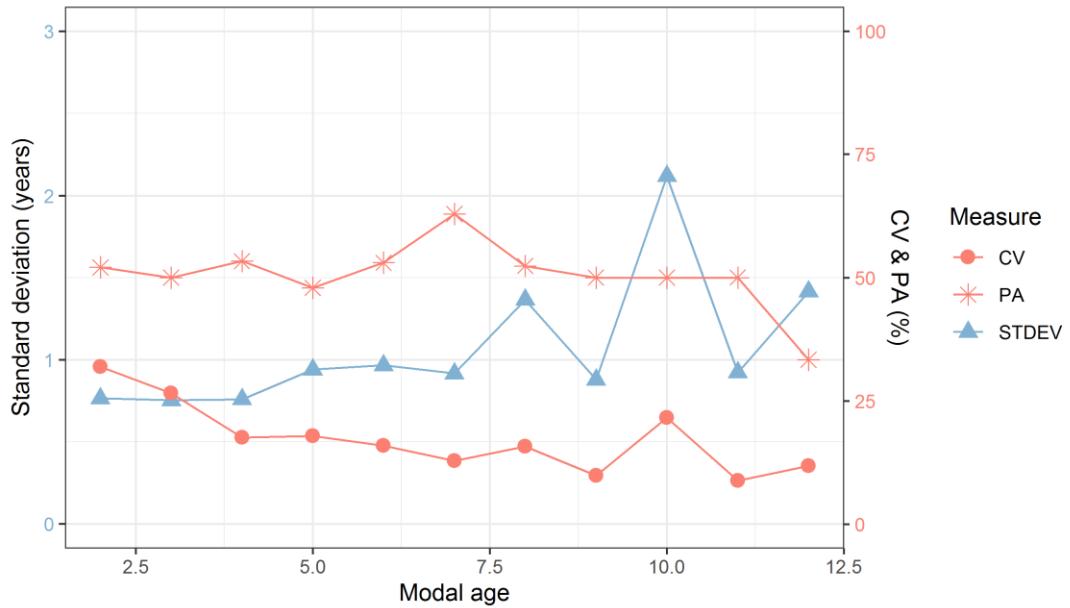

Figure 10.3.7: CV, PA and (STDEV (standard deviation) are plotted against modal age.

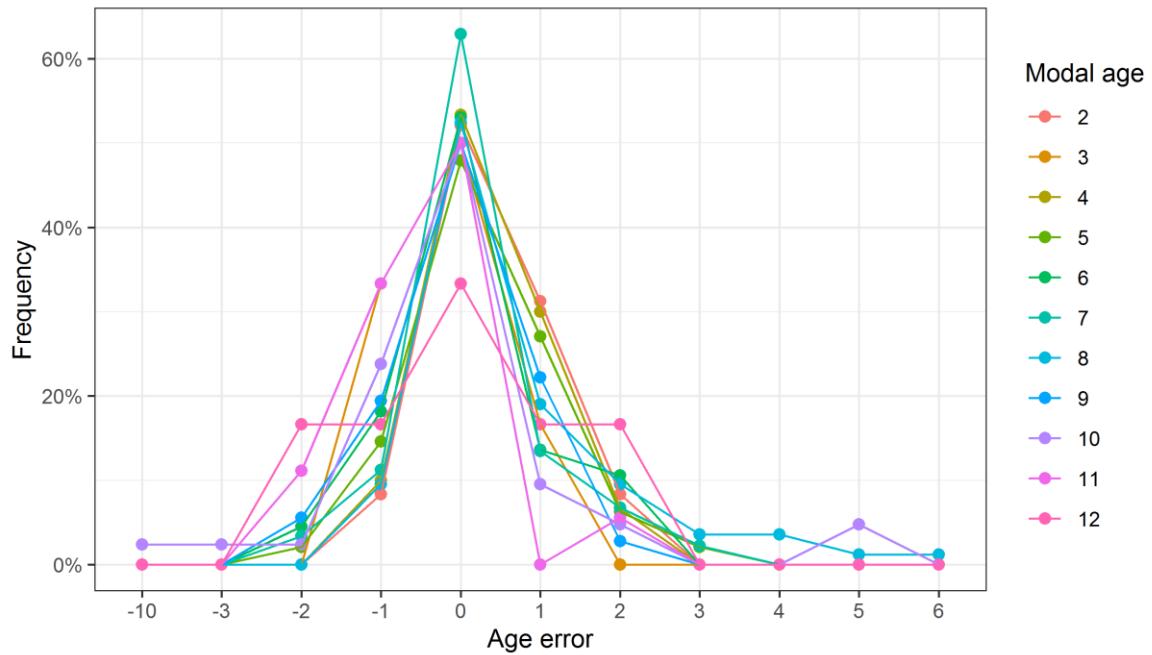

Figure 10.3.8: The distribution of the age reading errors in percentage by modal age as observed from the whole group of age readers in an age reading comparison to modal age. The achieved precision in age reading by MODAL age group is shown by the spread of the age readings errors. There appears to be no relative bias if the age reading errors are normally distributed. The distributions are skewed if relative bias occurs.

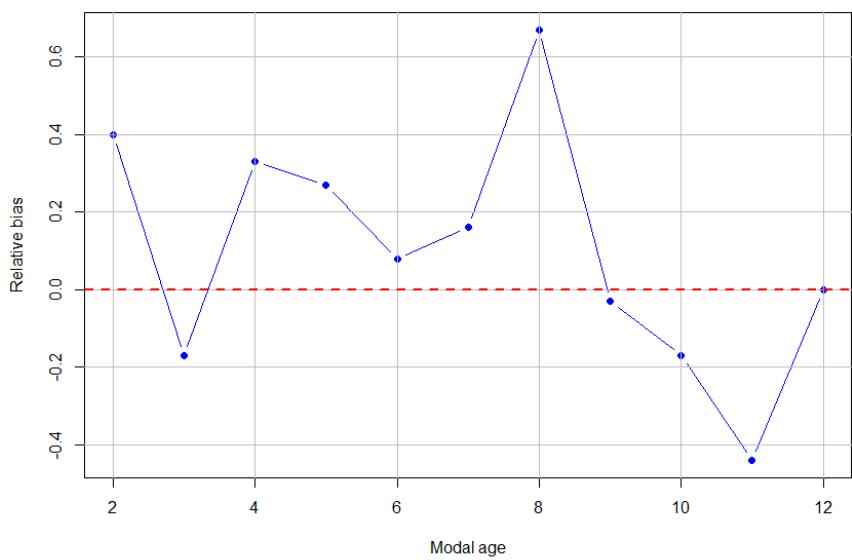

Figure 10.3.9: The relative bias by modal age as estimated by all age readers combined.

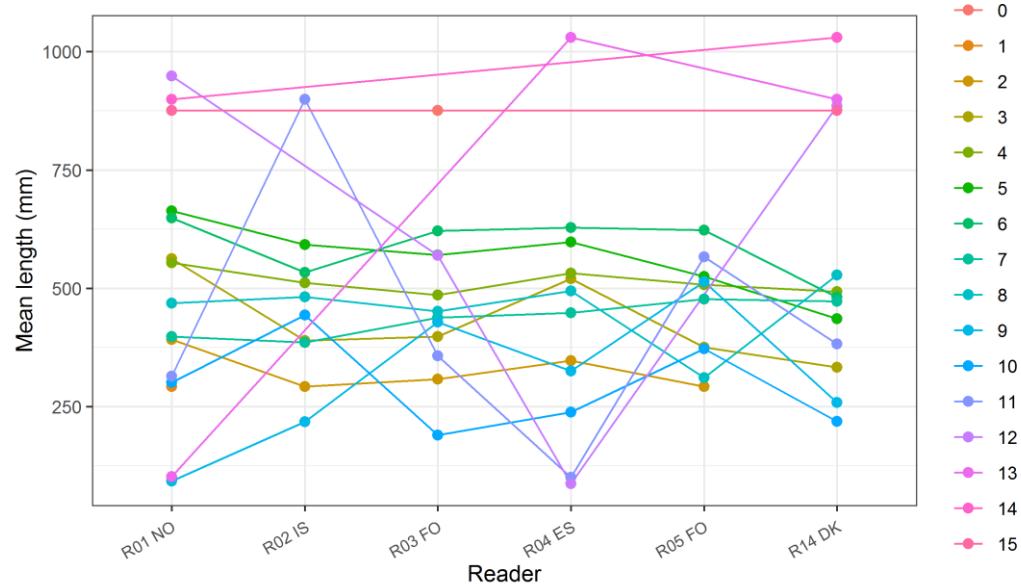

Figure 10.3.10: The mean length at age as estimated by each age reader.

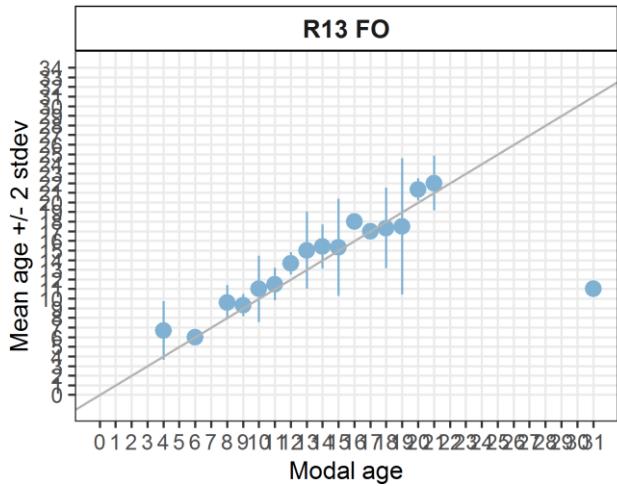

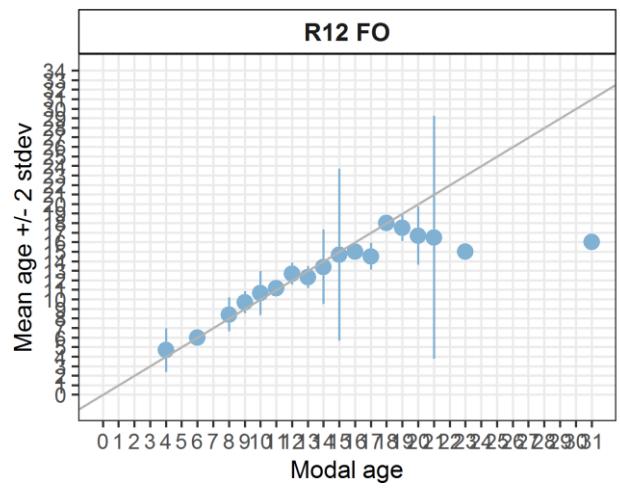

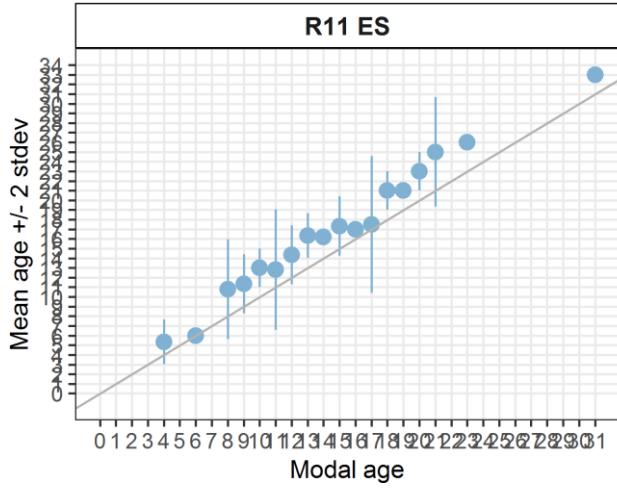

Figure 10.4.1: Age bias plot for advanced readers. Mean age recorded ± 2 stdev of each reader are plotted against modal age. The estimated mean age corresponds to modal age if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

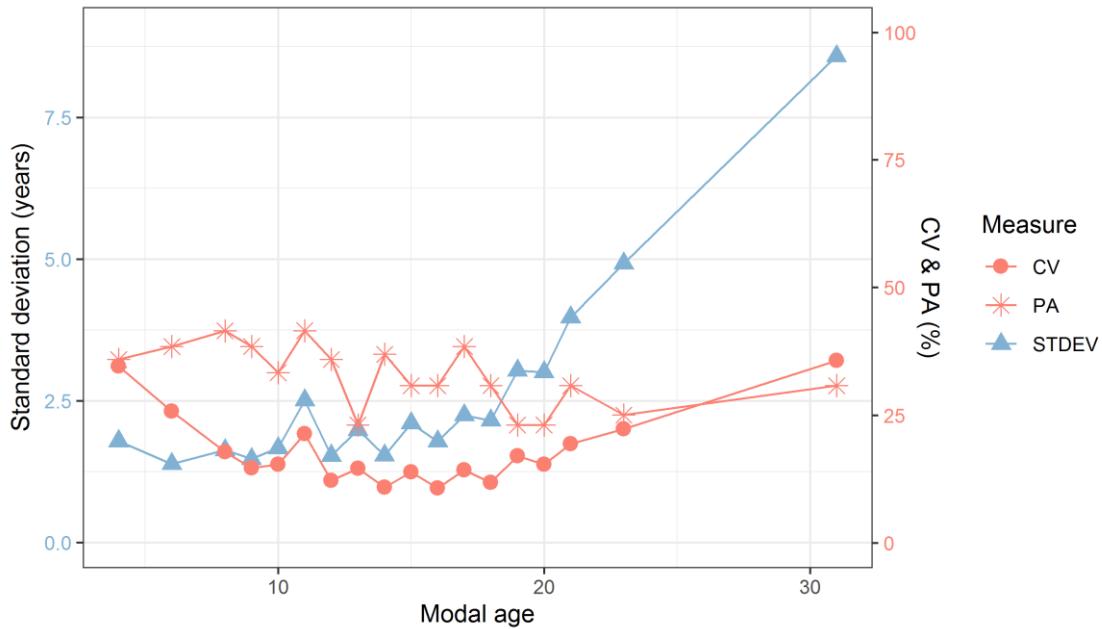

Figure 10.4.2: CV, PA and (STDEV (standard deviation) are plotted against modal age.

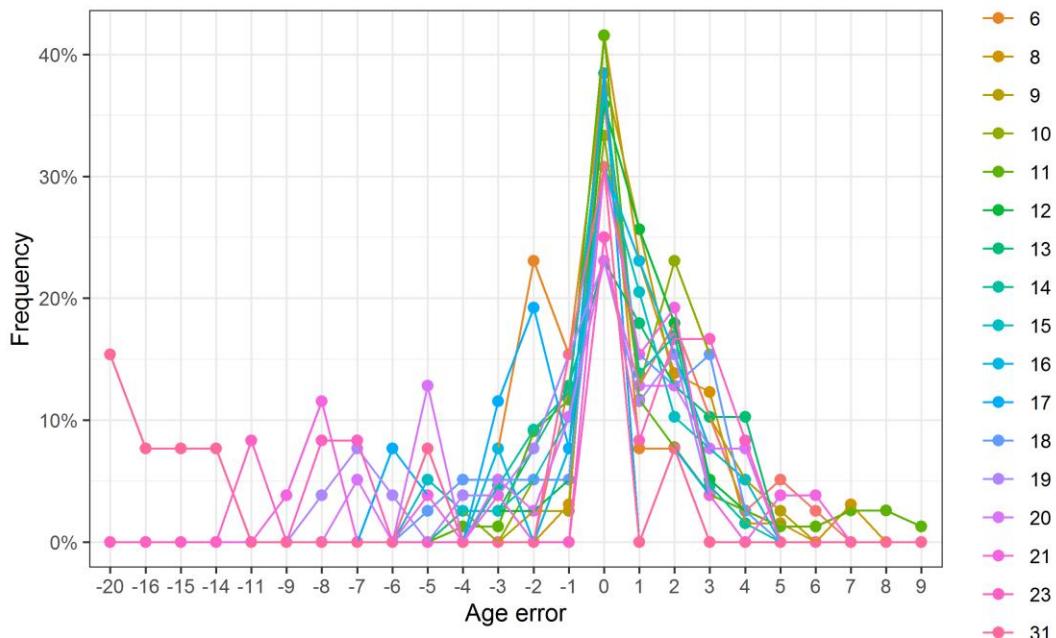

Figure 10.4.3: The distribution of the age reading errors in percentage by modal group of age readers in an age reading comparison to modal age. The achieved precision in age reading by MODAL age group is shown by the spread of the age readings errors. There appears to be no relative bias if the age reading errors are normally distributed. The distributions are skewed if relative bias occurs.

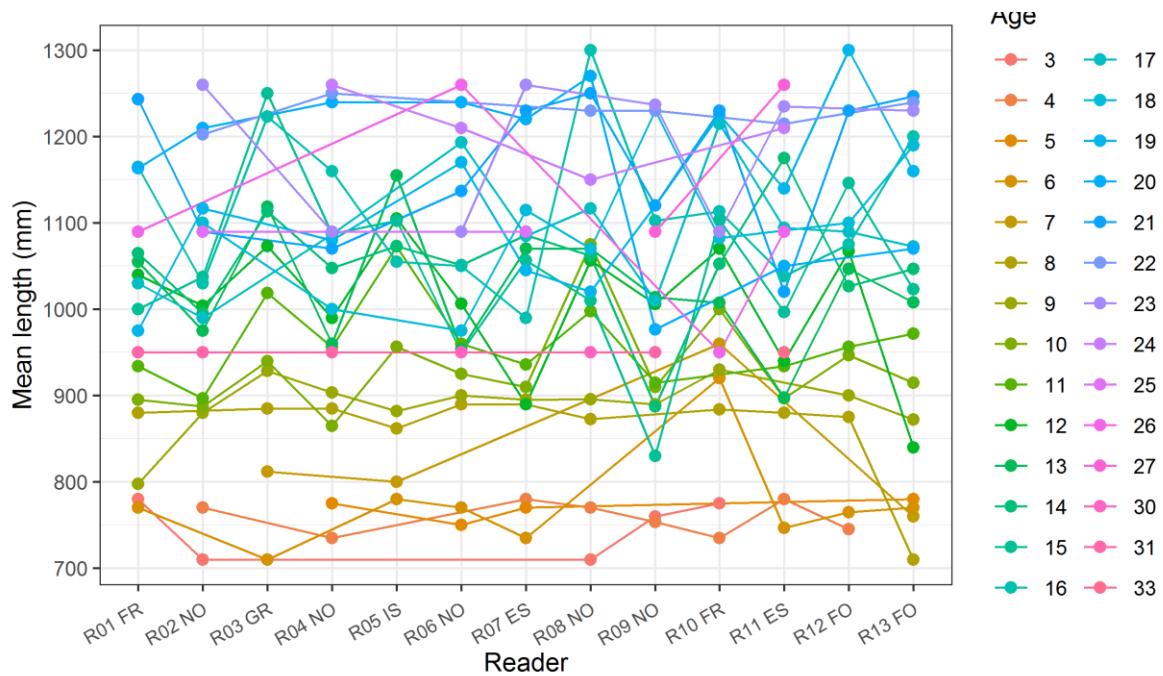

Figure 10.4.4: The mean length at age as estimated by each age reader.

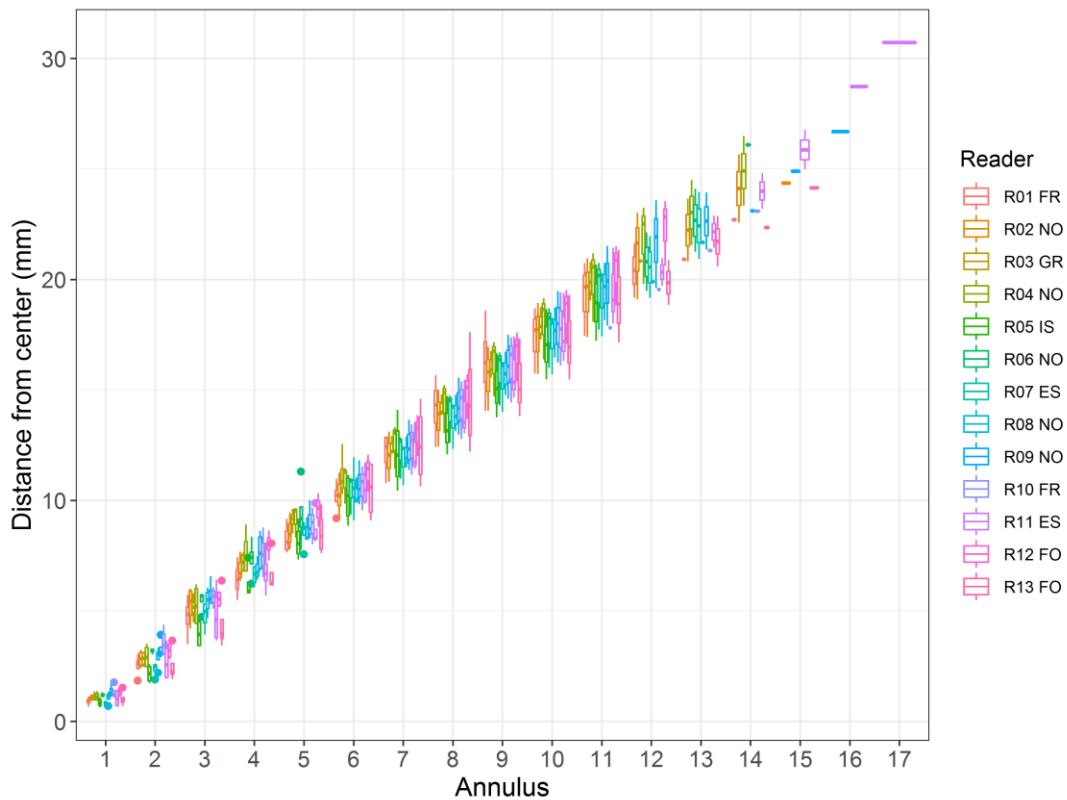

Figure 10.4.5: Plot of average distance from the centre to the winter rings for advanced readers by strata. The boxes represent the median, upper and lower box boundaries of the interquartile range, whiskers represent the minimum and maximum values, and the dots represent the outliers.

Advanced readers

All samples included

Data Overview

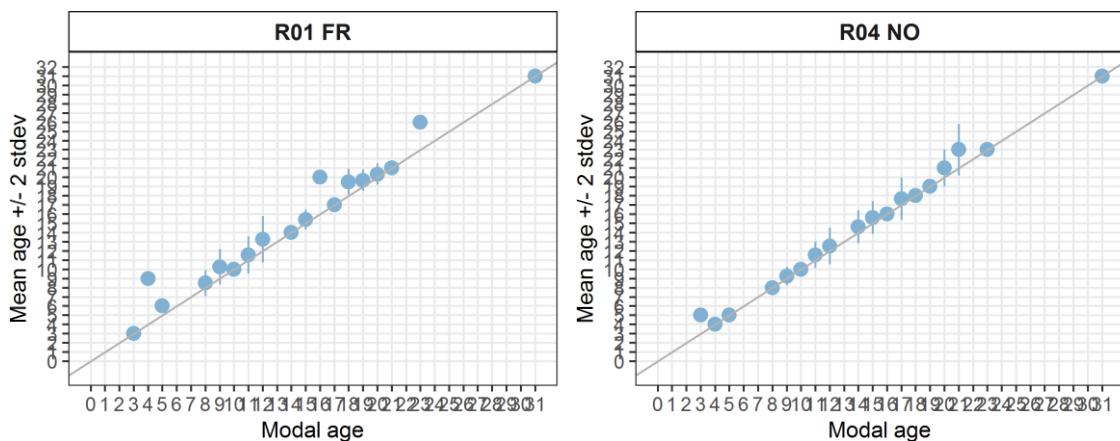

Figure 10.4.6: Age bias plot for advanced readers. Mean age recorded ± 2 stdev of each reader are plotted against modal age. The estimated mean age corresponds to modal age if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

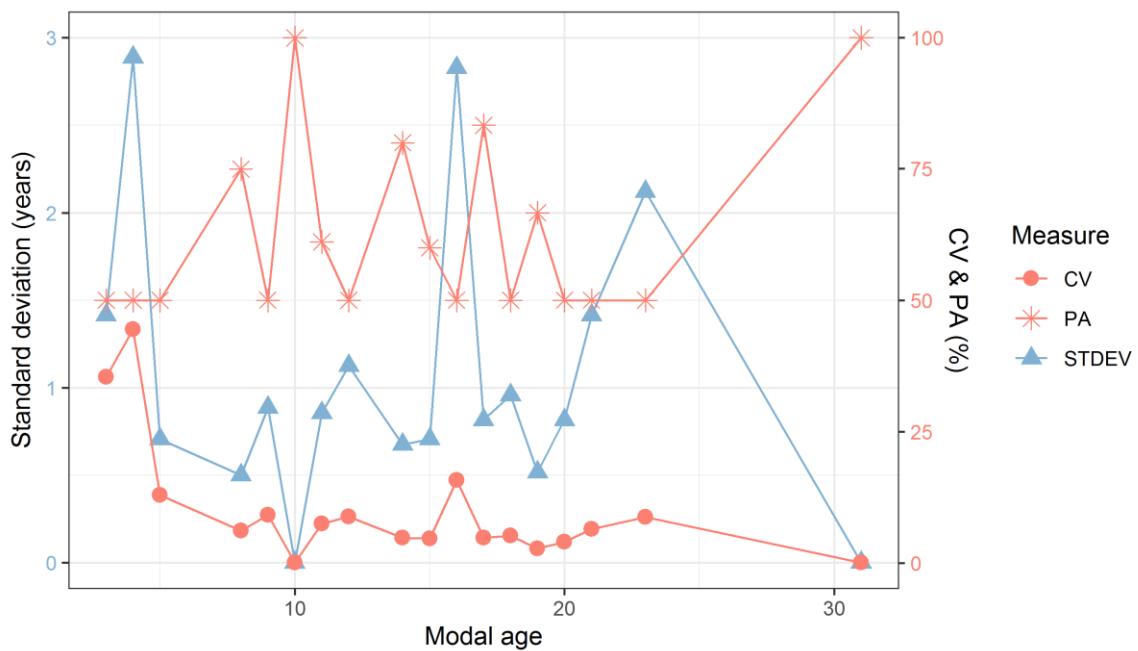

Figure 10.4.7: CV, PA and (STDEV (standard deviation) are plotted against modal age.

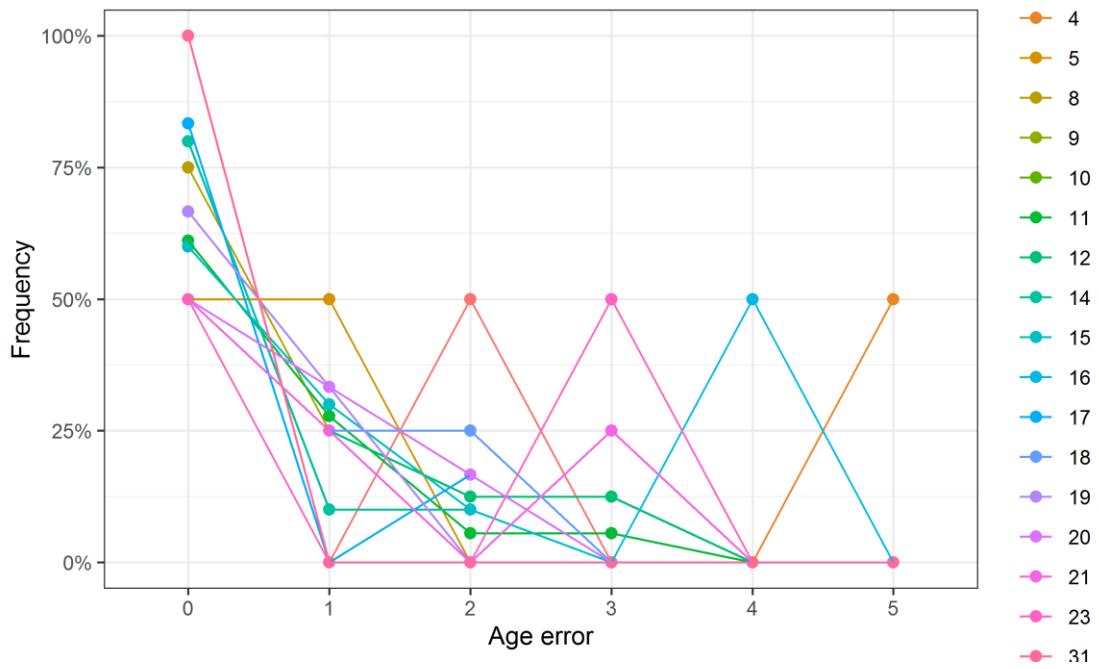

Figure 10.4.8: The distribution of the age reading errors in percentage by modal age as observed from the whole group of age readers in an age reading comparison to modal age. The achieved precision in age reading by MODAL age group is shown by the spread of the age readings errors. There appears to be no relative bias if the age reading errors are normally distributed. The distributions are skewed if relative bias occurs.

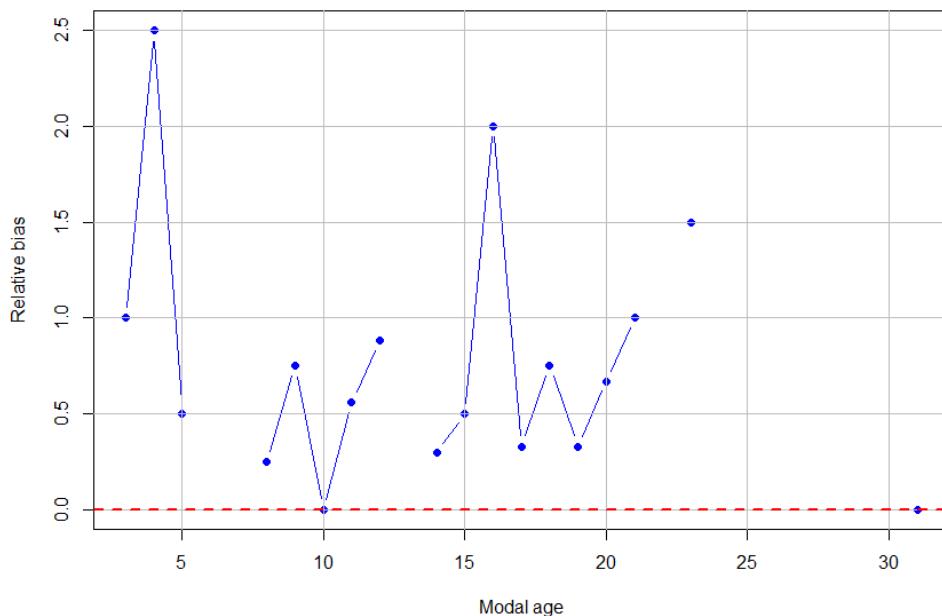

Figure 10.4.9: The relative bias by modal age as estimated by all age readers combined.

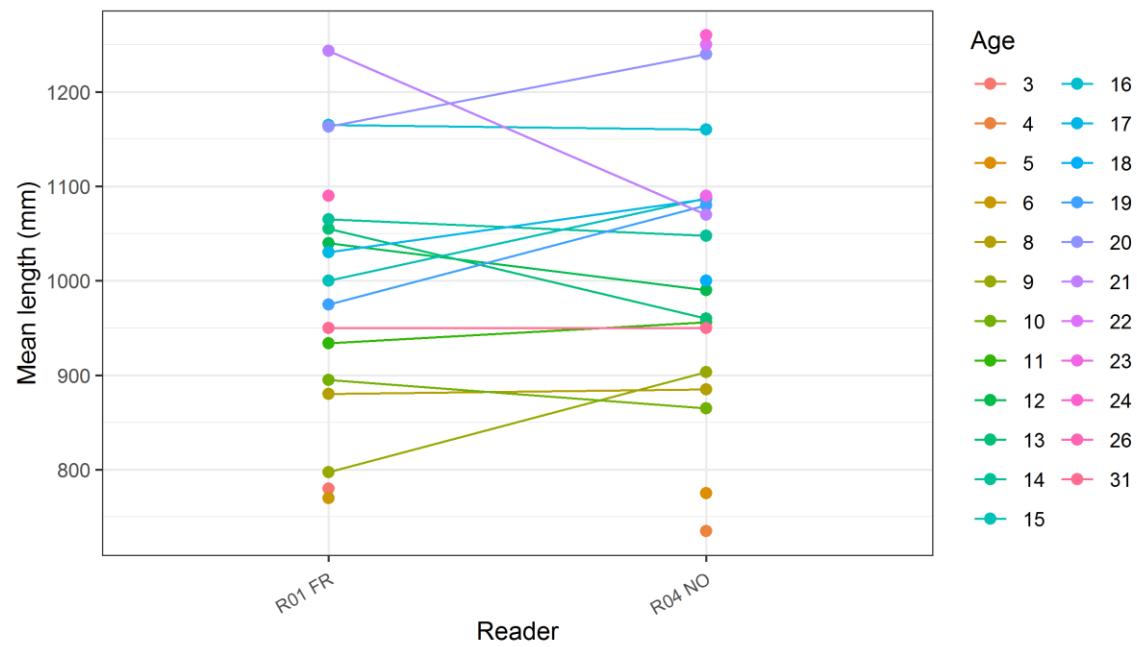

Figure 10.4.10: The mean length at age as estimated by each age reader.

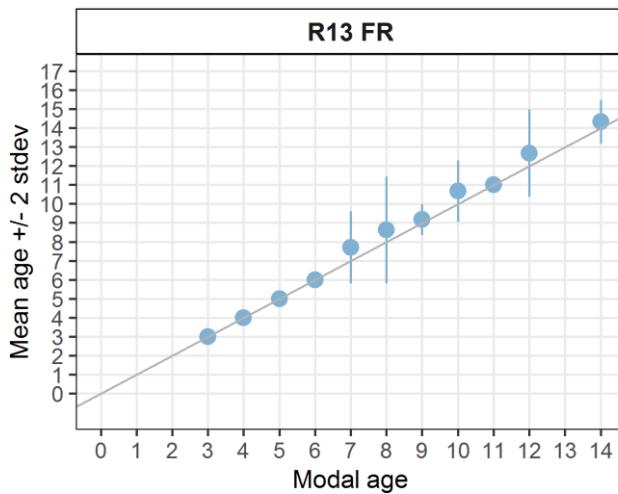

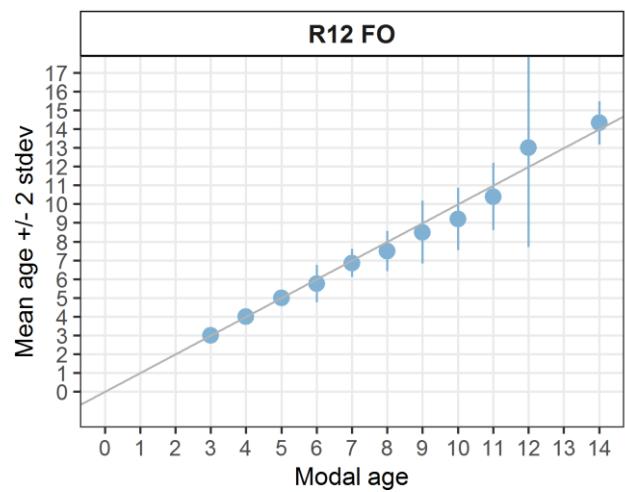

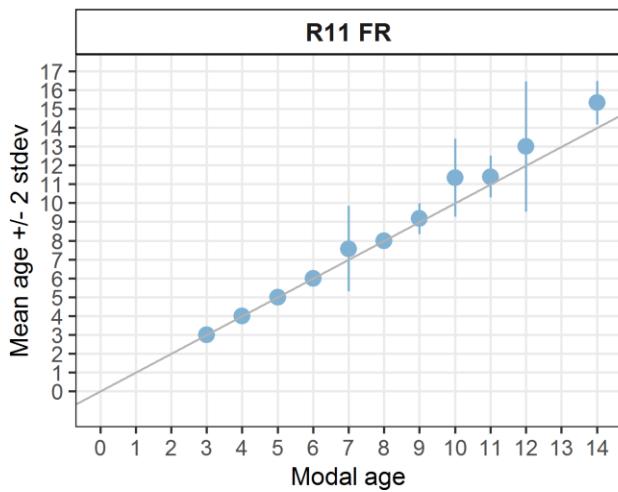

Figure 10.5.1: Age bias plot for all readers. Mean age recorded \pm 2 stdev of each reader are plotted against modal age. The estimated mean age corresponds to modal age if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

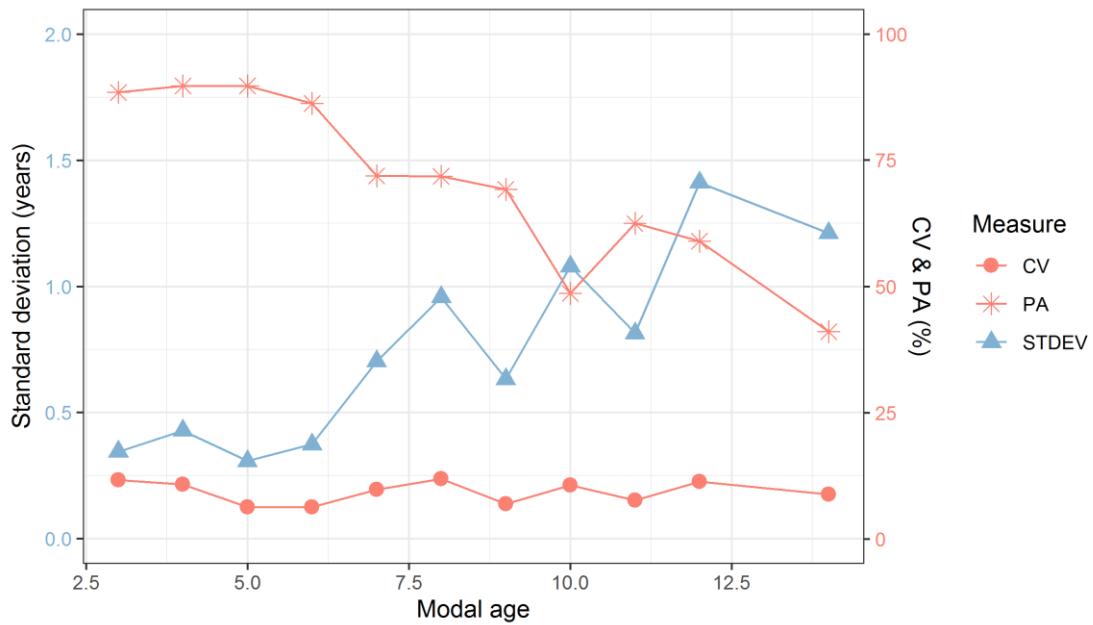

Figure 10.5.2: CV, PA and (STDEV (standard deviation) are plotted against modal age.

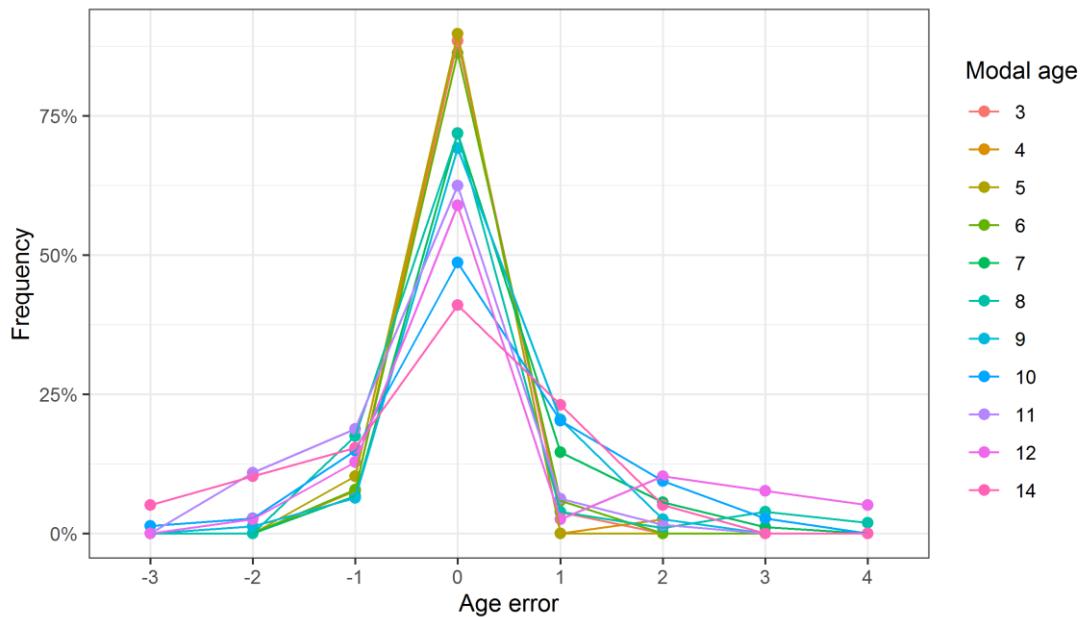

Figure 10.5.3: The distribution of the age reading errors in percentage by modal age as observed from the whole group of age readers in an age reading comparison to modal age. The achieved precision in age reading by MODAL age group is shown by the spread of the age readings errors. There appears to be no relative bias if the age reading errors are normally distributed. The distributions are skewed if relative bias occurs.

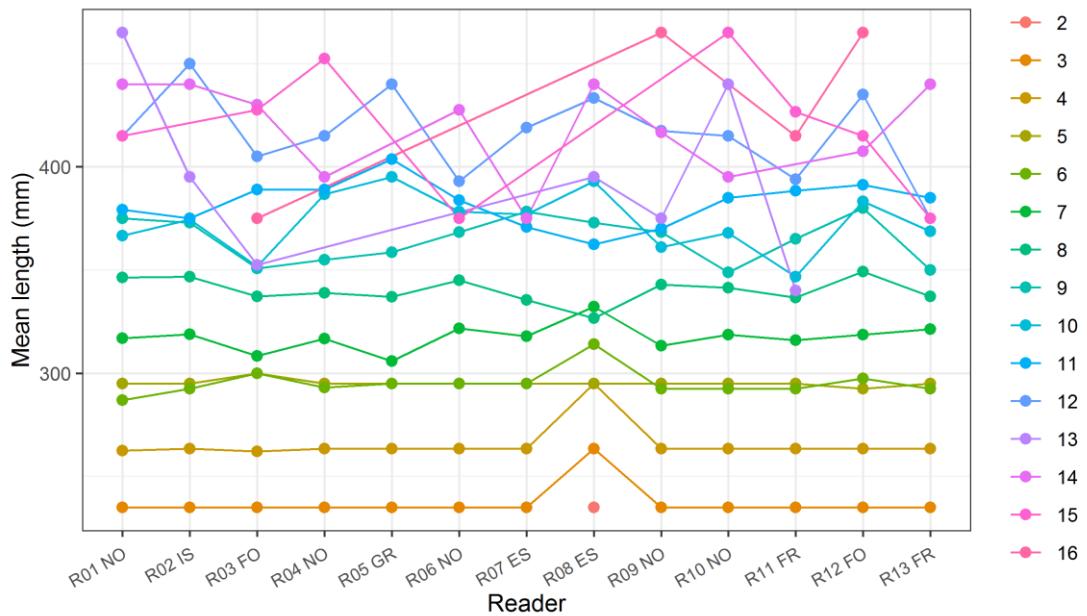

Figure 10.5.4: The mean length at age as estimated by each age reader.

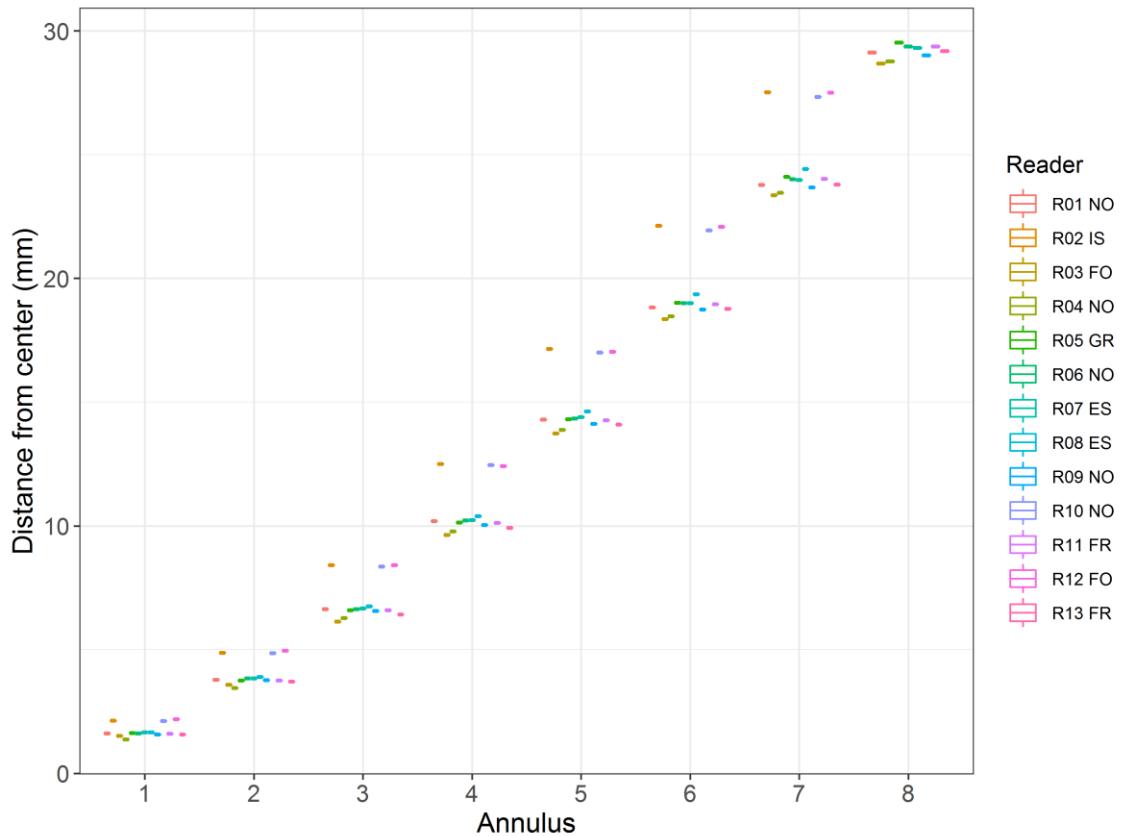

Figure 10.5.5: Plot of average distance from the centre to the winter rings for advanced readers by preparation method. The boxes represent the median, upper and lower box boundaries of the interquartile range, whiskers represent the minimum and maximum values, and the dots represent the outliers.

Table 10.5.6: Number of age readings table gives an overview of number of readings per reader and modal age. The total numbers of readings per reader and per modal age are summarized at the end of the table.

Modal age	R01 NO	R02 IS	R03 FO	total
3	2	2	2	6
4	3	3	3	9
5	3	3	3	9
6	4	4	4	12
7	7	7	7	21
8	9	9	9	27
9	5	5	5	15
10	9	9	9	27
11	4	4	4	12
12	2	2	2	6
13	0	0	0	0
14	1	1	1	3
15	1	1	1	3
Total	50	50	50	150

Table 10.5.7: Age composition by reader gives a summary of number of readings per reader.

Modal age	R01 NO	R02 IS	R03 FO
3	2	2	1
4	2	3	5
5	3	3	2
6	5	4	3
7	8	9	6
8	7	6	7
9	3	7	7
10	9	8	3
11	6	3	5
12	2	2	4
13	1	2	2
14	1	1	2
15	1	0	2
16	0	0	1
Total	50	50	50

Table 10.5.8: Mean length at age per reader is calculated per reader and age (not modal age) and for all readers combined per age. A weighted mean is also given.

Age	R01 NO	R02 IS	R03 FO
3	235 mm	235 mm	235 mm
4	262 mm	263 mm	262 mm
5	295 mm	295 mm	300 mm
6	287 mm	292 mm	300 mm
7	317 mm	319 mm	308 mm
8	346 mm	347 mm	337 mm
9	375 mm	373 mm	351 mm
10	367 mm	374 mm	352 mm
11	379 mm	375 mm	389 mm
12	415 mm	450 mm	405 mm
13	465 mm	395 mm	352 mm
14	440 mm	440 mm	430 mm
15	415 mm	-	428 mm
16	-	-	375 mm
Weighted Mean	342 mm	342 mm	342 mm

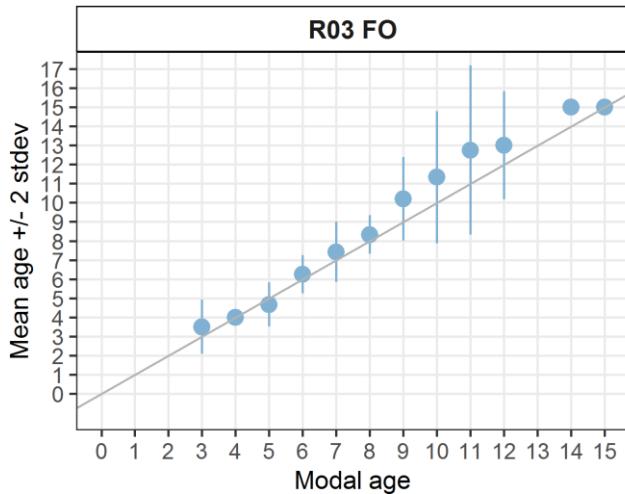

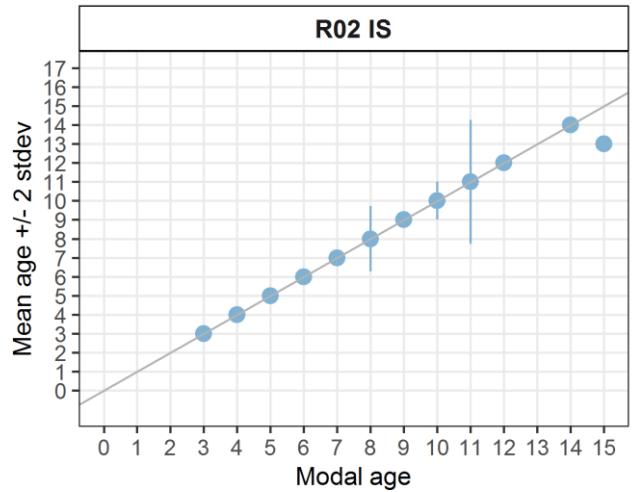

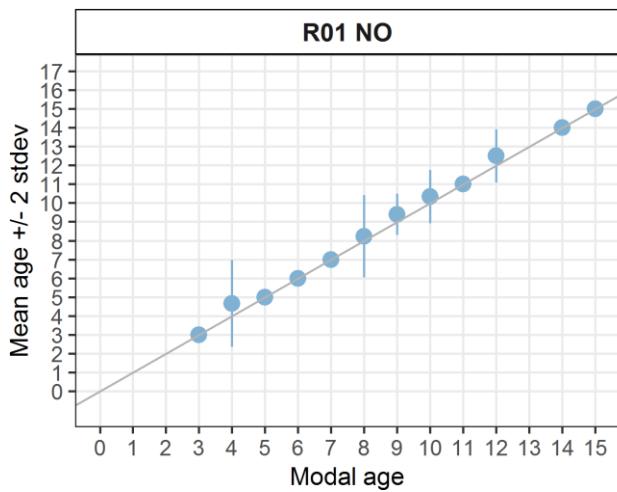

Figure 10.5.6: Age bias plot for advanced readers. Mean age recorded +/- 2 stdev of each reader are plotted against modal age. The estimated mean age corresponds to modal age if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

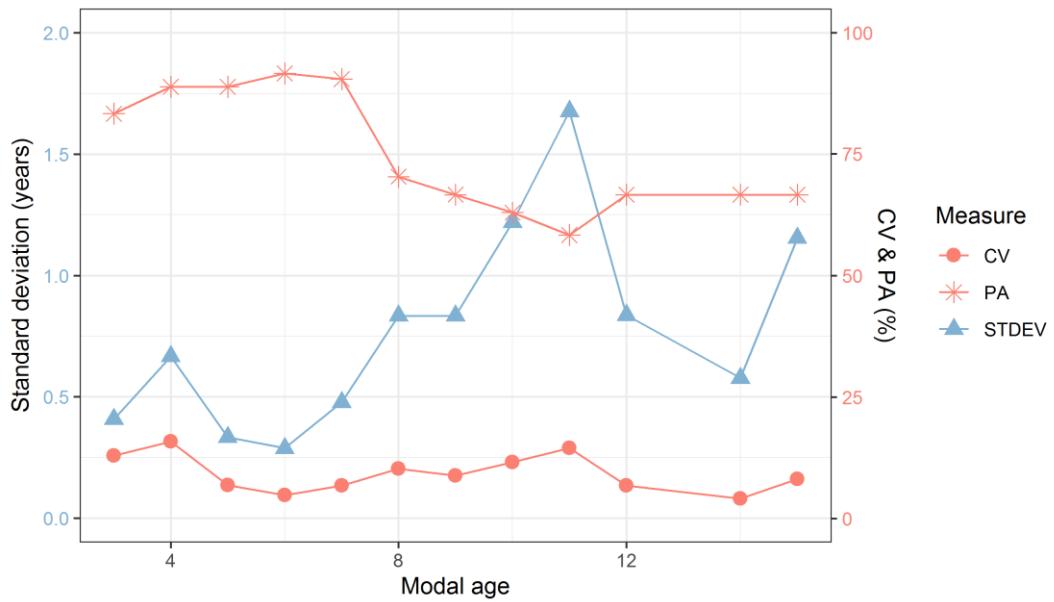

Figure 10.5.7: CV, PA and (STDEV (standard deviation) are plotted against modal age.

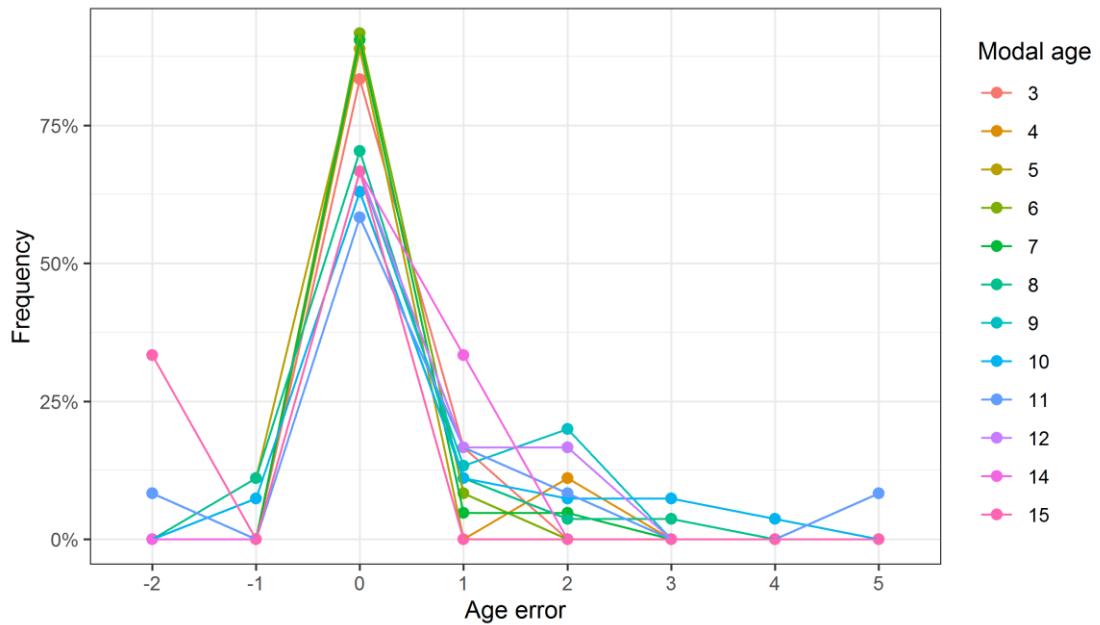

Figure 10.5.8: The distribution of the age reading errors in percentage by modal age as observed from the whole group of age readers in an age reading comparison to modal age. The achieved precision in age reading by MODAL age group is shown by the spread of the age readings errors. There appears to be no relative bias if the age reading errors are normally distributed. The distributions are skewed if relative bias occurs.

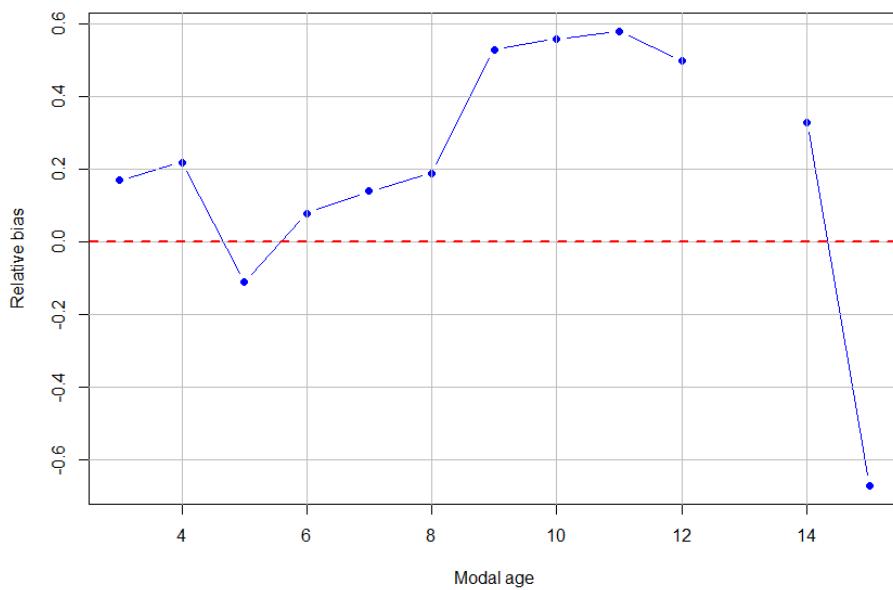

Figure 10.5.9: The relative bias by modal age as estimated by all age readers combined.

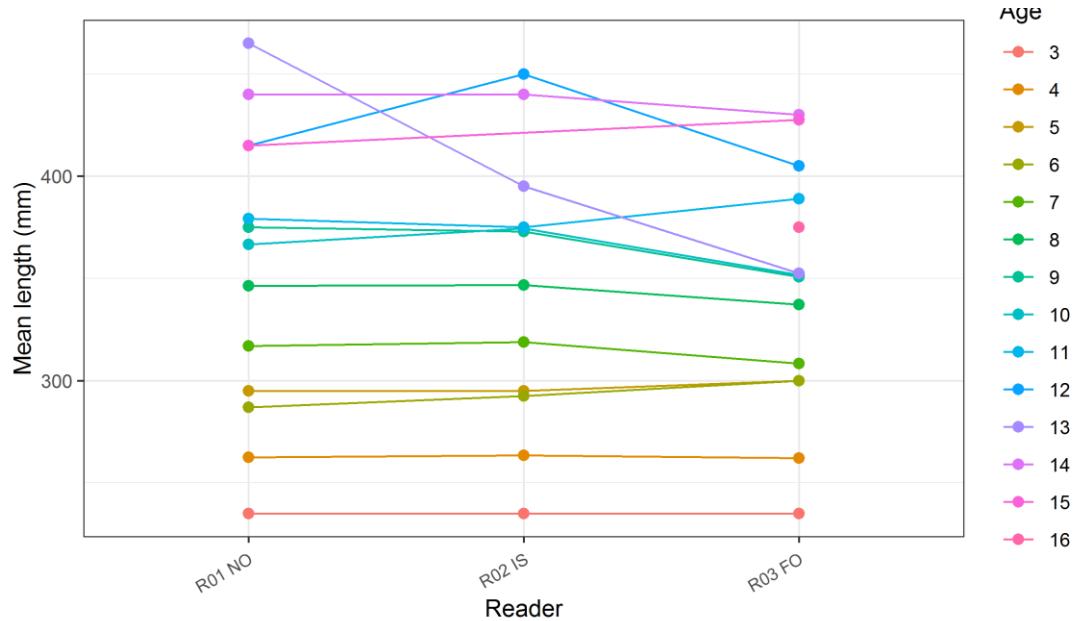

Figure 10.5.10: The mean length at age as estimated by each age reader.

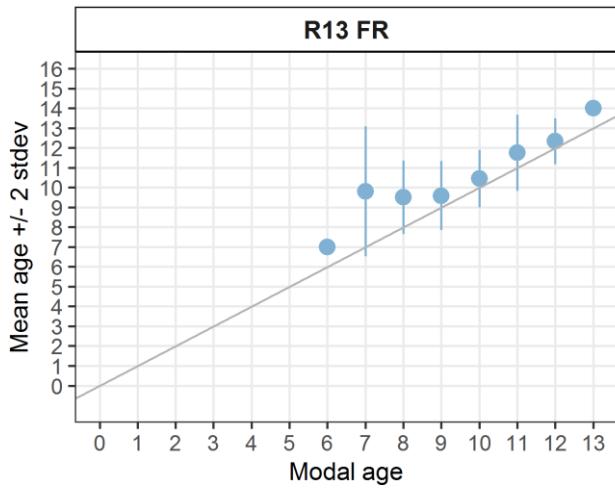

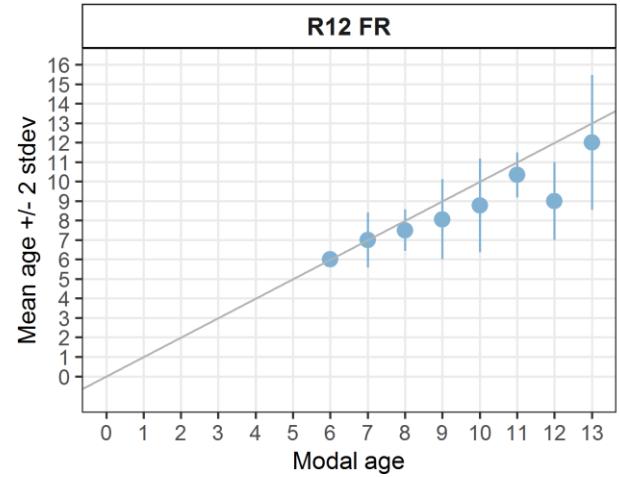

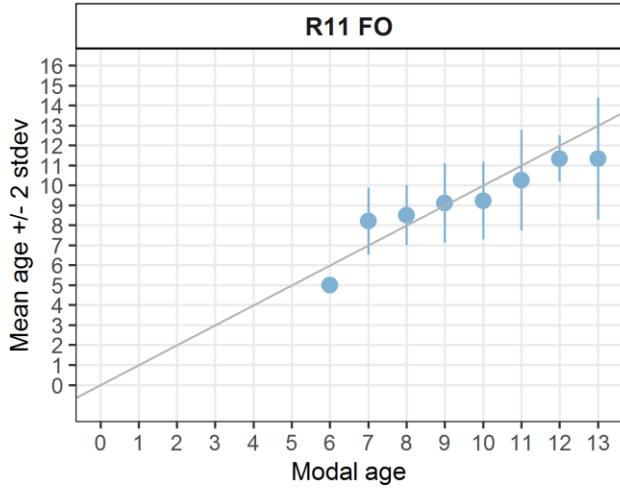

Figure 10.6.1: Age bias plot for all readers. Mean age recorded \pm 2 stdev of each reader are plotted against modal age. The estimated mean age corresponds to modal age if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

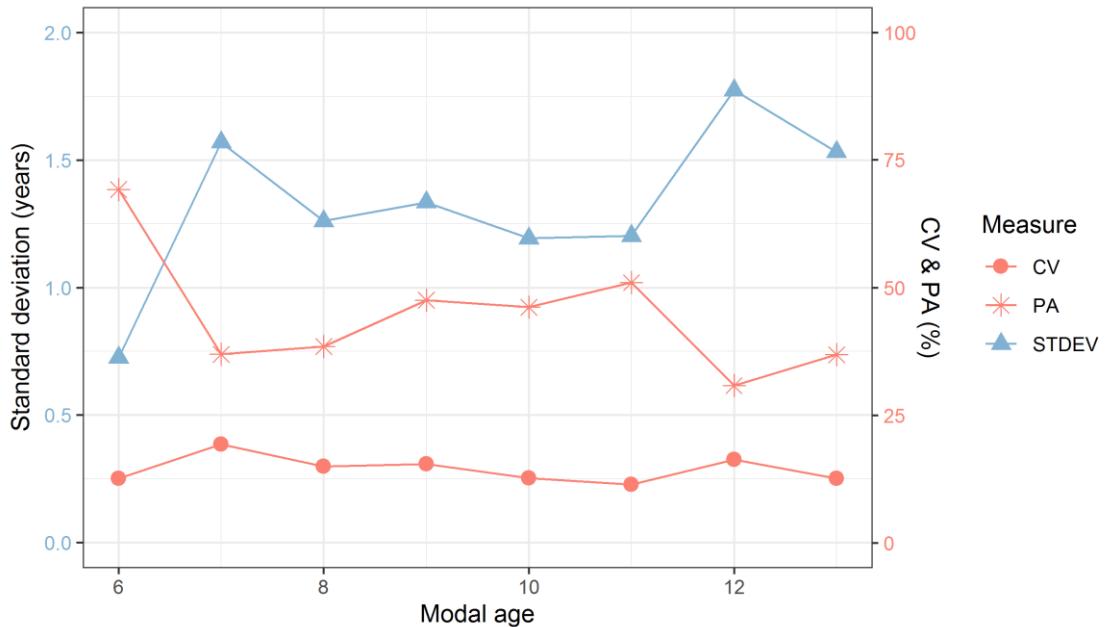

Figure 10.6.2: CV, PA and (STDEV (standard deviation) are plotted against modal age.

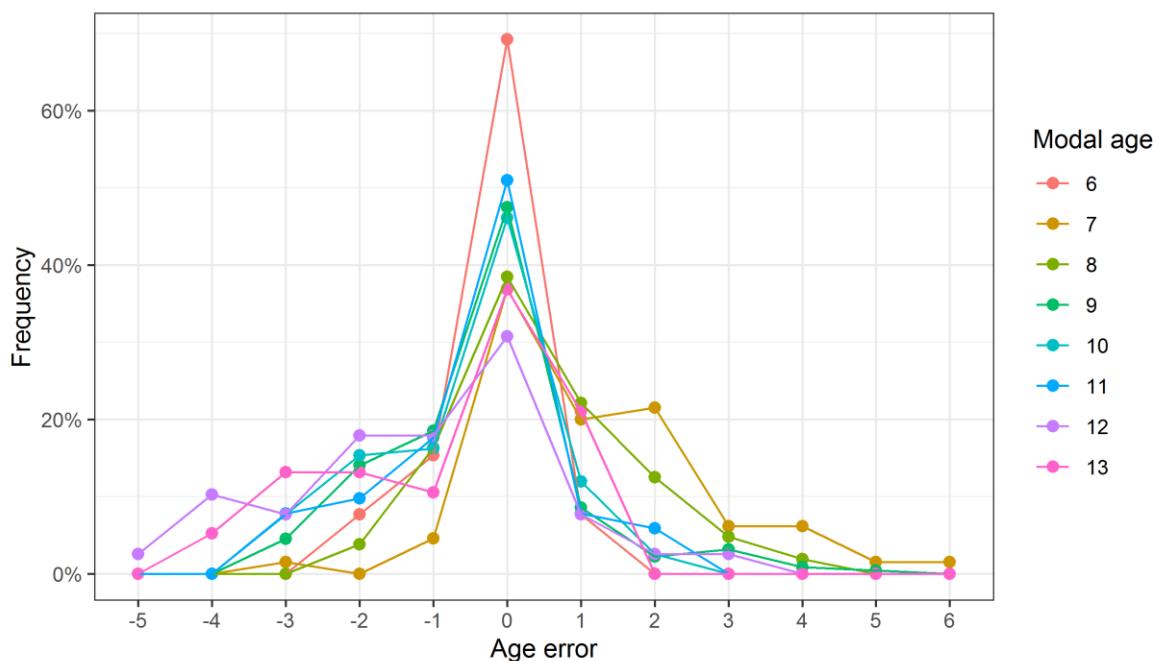

Figure 10.6.3: The distribution of the age reading errors in percentage by modal age as observed from the whole group of age readers in an age reading comparison to modal age. The achieved precision in age reading by MODAL age group is shown by the spread of the age readings errors. There appears to be no relative bias if the age reading errors are normally distributed. The distributions are skewed if relative bias occurs.

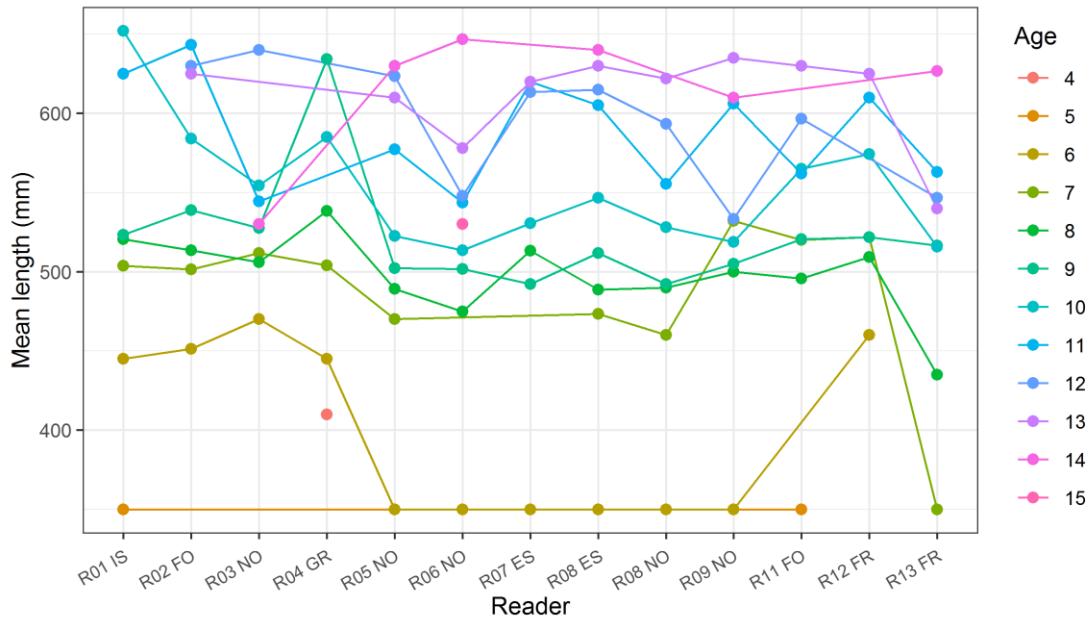

Figure 10.6.4: The mean length at age as estimated by each age reader.

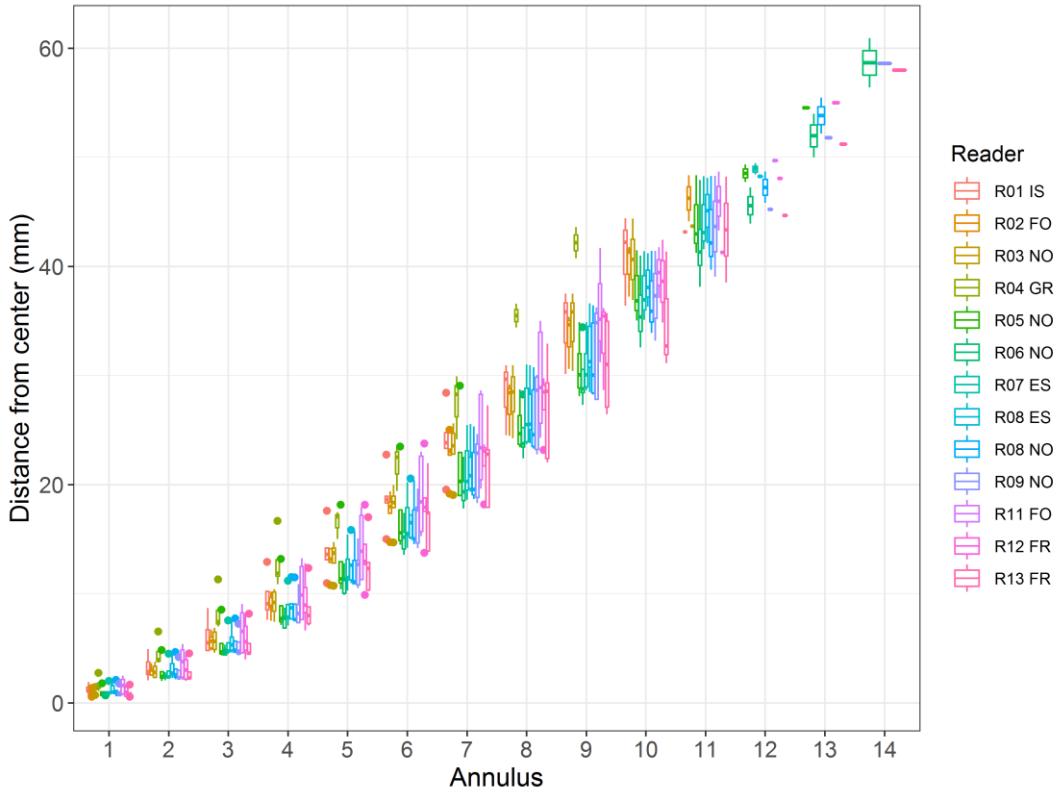

Figure 10.6.5: Plot of average distance from the centre to the winter rings for advanced readers by preparation method. The boxes represent the median, upper and lower box boundaries of the interquartile range, whiskers represent the minimum and maximum values, and the dots represent the outliers.

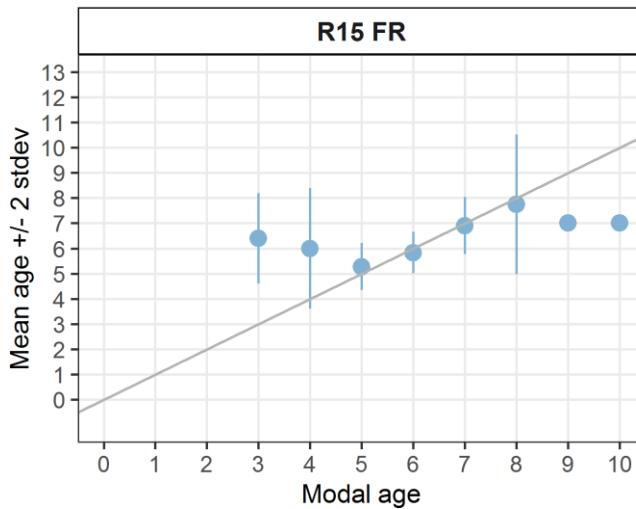

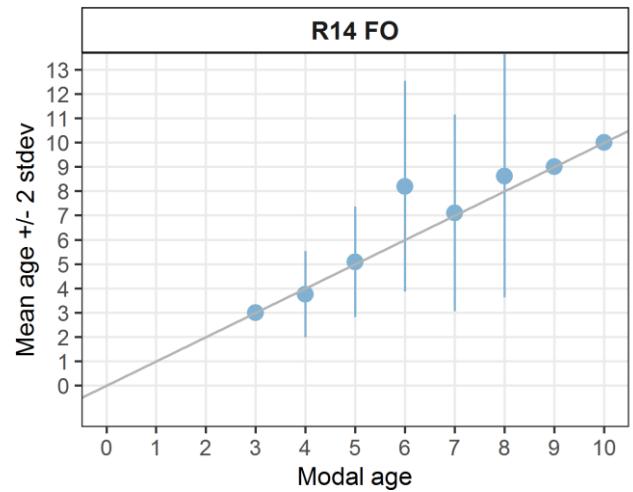

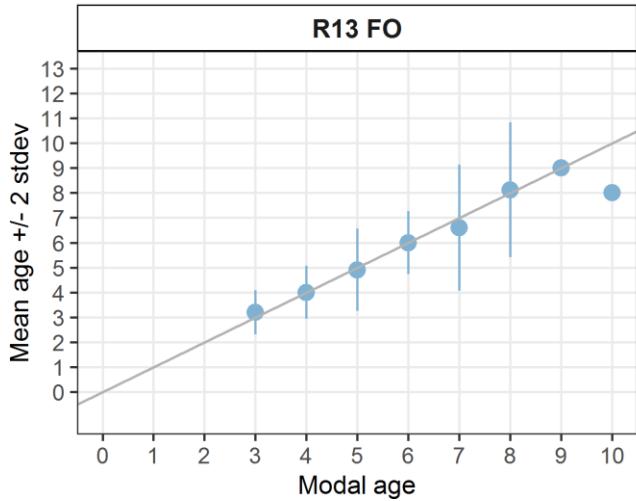

Figure 10.7.1: Age bias plot for all readers. Mean age recorded +/- 2 stdev of each reader are plotted against modal age. The estimated mean age corresponds to modal age if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

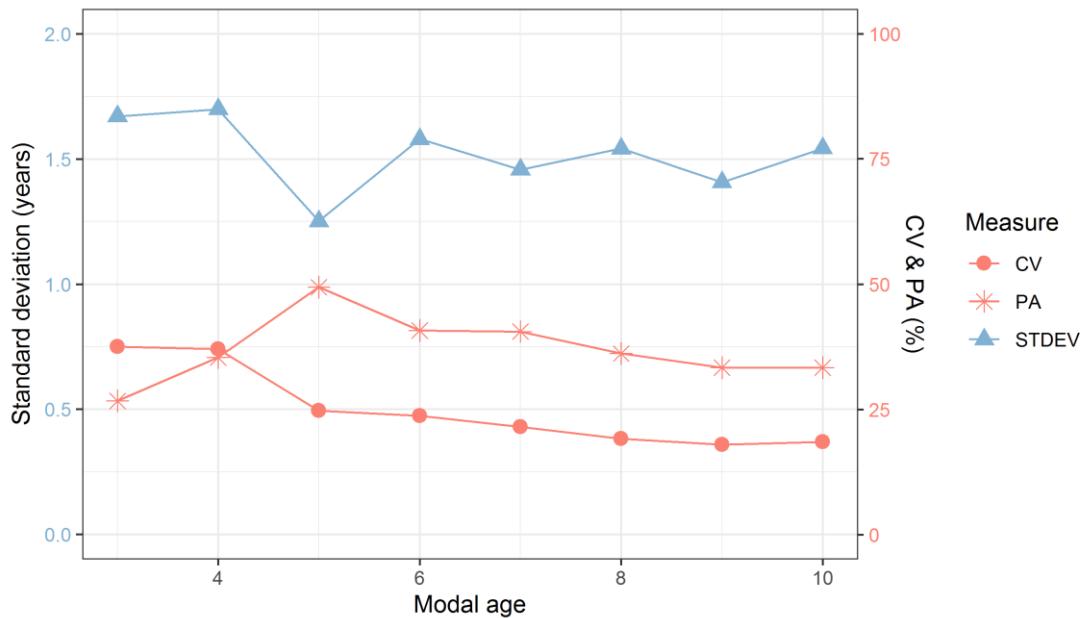

Figure 10.7.2: CV, PA and (STDEV (standard deviation) are plotted against modal age.

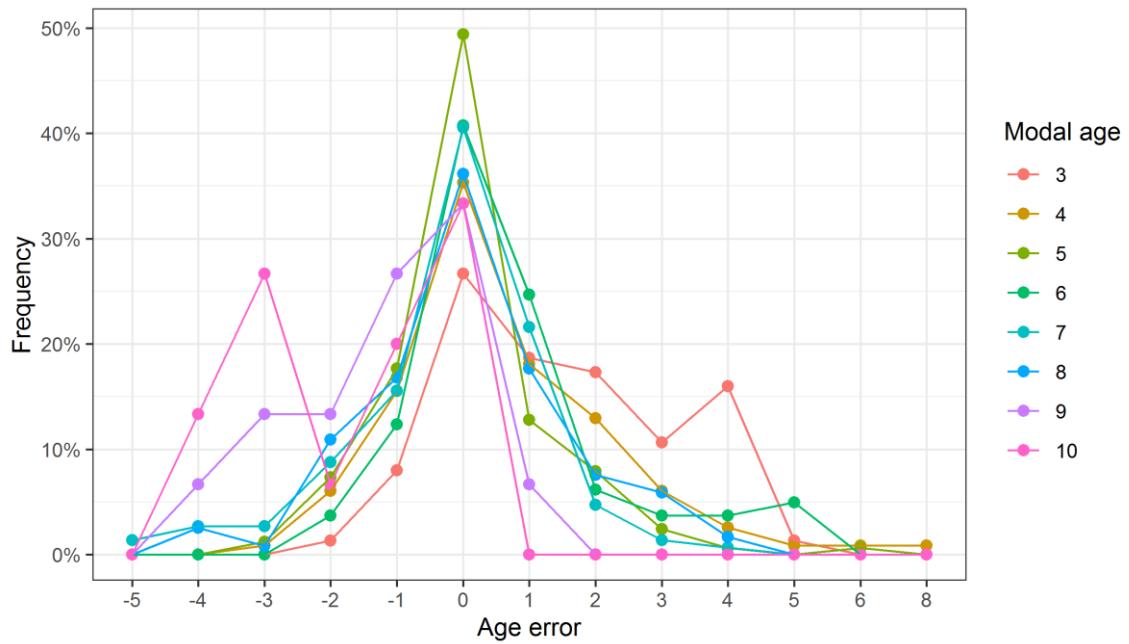

Figure 10.7.3: The distribution of the age reading errors in percentage by modal age as observed from the whole group of age readers in an age reading comparison to modal age. The achieved precision in age reading by MODAL age group is shown by the spread of the age readings errors. There appears to be no relative bias if the age reading errors are normally distributed. The distributions are skewed if relative bias occurs.

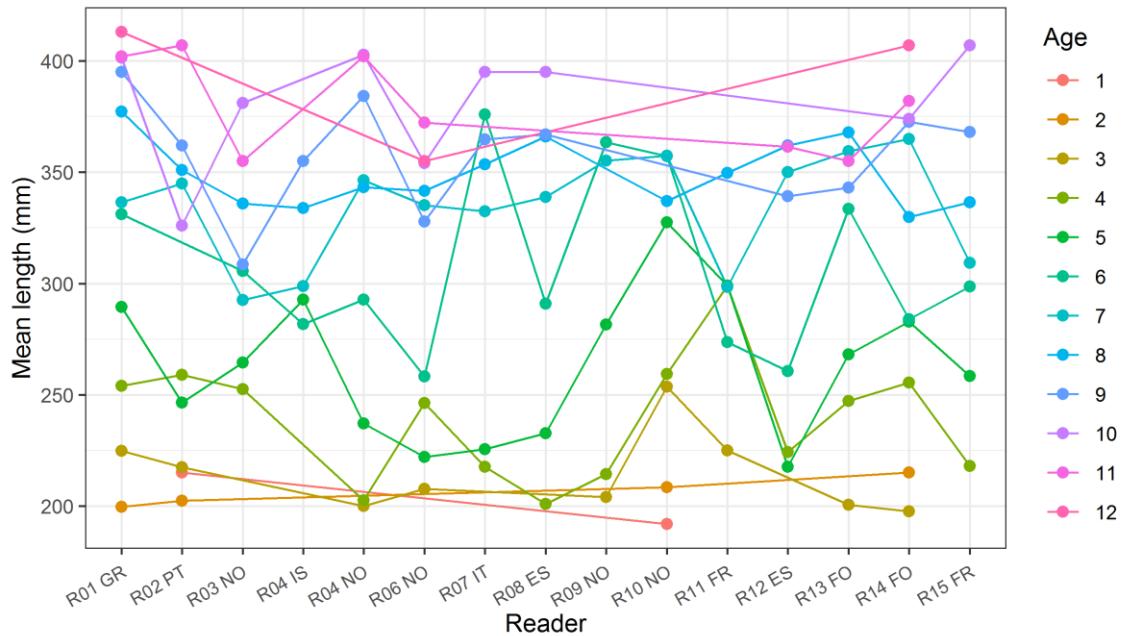

Figure 10.7.4: The mean length at age as estimated by each age reader.

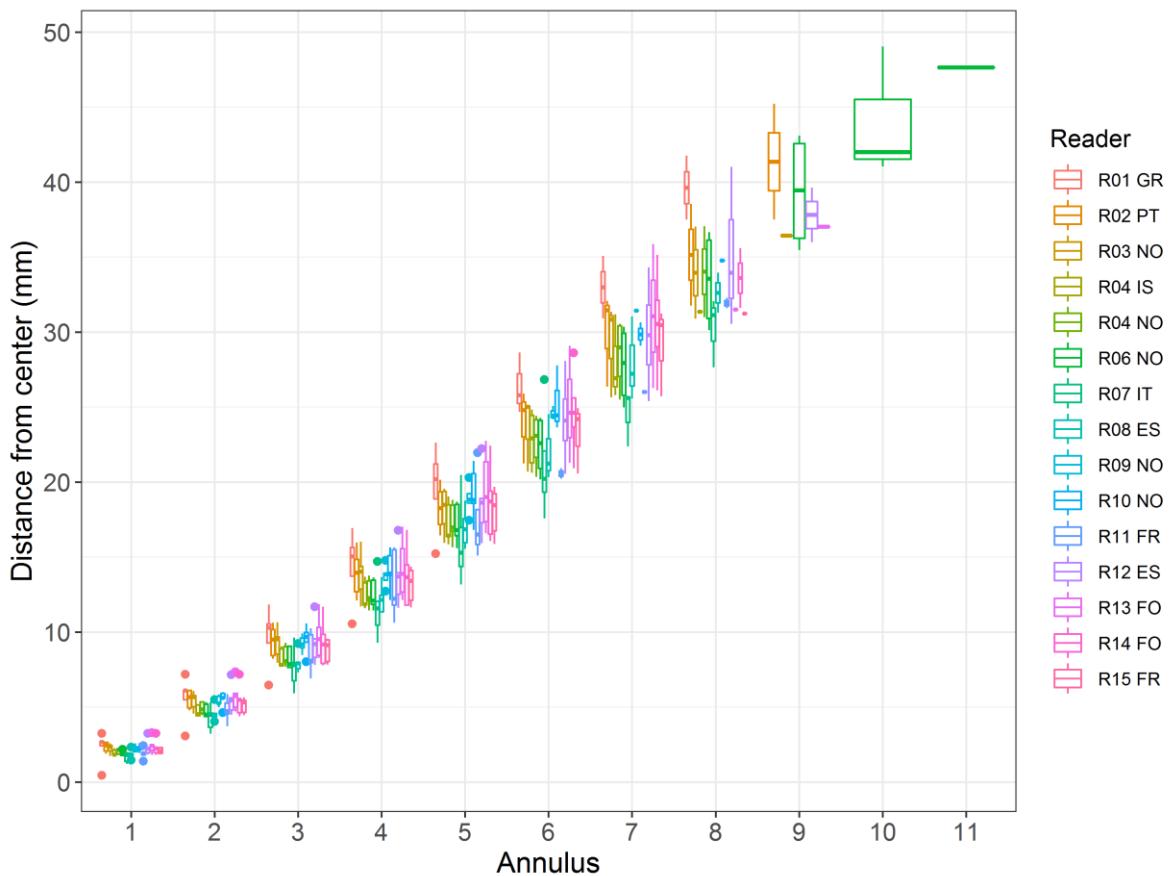

Figure 10.7.5: Plot of average distance from the centre to the winter rings for advanced readers by preparation method. The boxes represent the median, upper and lower box boundaries of the interquartile range, whiskers represent the minimum and maximum values, and the dots represent the outliers.

Advanced readers

All samples included

Data Overview

Table 10.7.6: Number of age readings table gives an overview of number of readings per reader and modal age. The total numbers of readings per reader and per modal age are summarized at the end of the table.

Modal age	R01 GR	R02 PT	total
1	1	1	2
2	8	8	16
3	9	9	18
4	5	5	10
5	4	4	8
6	5	5	10
7	6	6	12
8	7	5	12
9	1	1	2
10	2	1	3
11	1	0	1
12	1	0	1
Total	50	45	95

Table 10.7.7: Age composition by reader gives a summary of number of readings per reader.

Modal age	R01 GR	R02 PT
1	0	1
2	8	2
3	10	9
4	2	9
5	5	4
6	6	0
7	5	7
8	7	6
9	1	5
10	4	1
11	1	1
12	1	0
Total	50	45

Table 10.7.8: Mean length at age per reader is calculated per reader and age (not modal age) and for all readers combined per age. A weighted mean is also given.

Age	R01 GR	R02 PT
1	-	215 mm
2	200 mm	202 mm
3	225 mm	217 mm
4	254 mm	259 mm
5	289 mm	246 mm
6	331 mm	-
7	336 mm	345 mm
8	377 mm	351 mm
9	395 mm	362 mm
10	402 mm	326 mm
11	402 mm	407 mm
12	413 mm	-
Weighted Mean	299 mm	288 mm

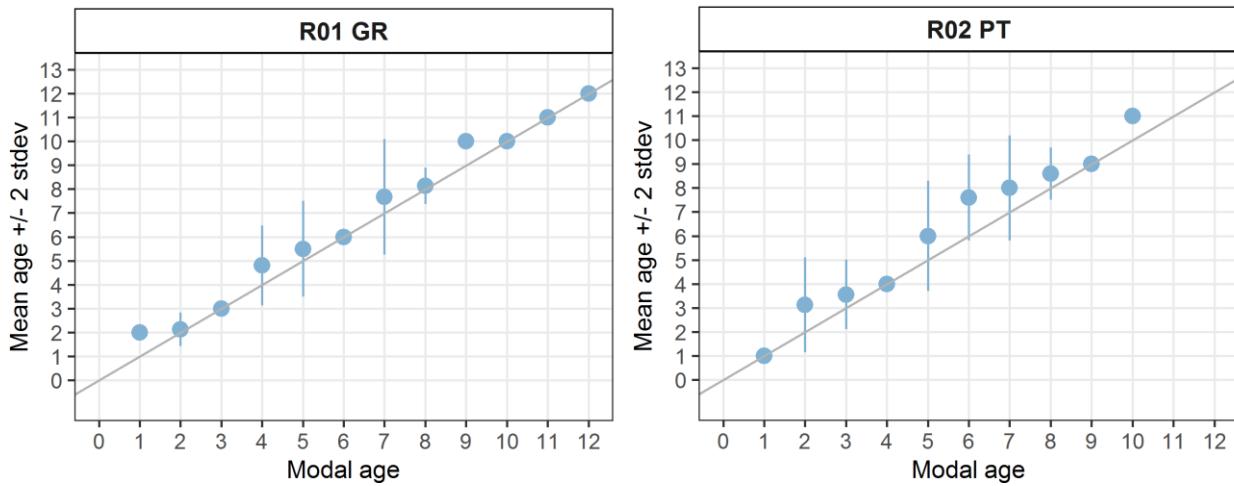

Figure 10.7.6: Age bias plot for advanced readers. Mean age recorded +/- 2 stdev of each reader are plotted against modal age. The estimated mean age corresponds to modal age if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

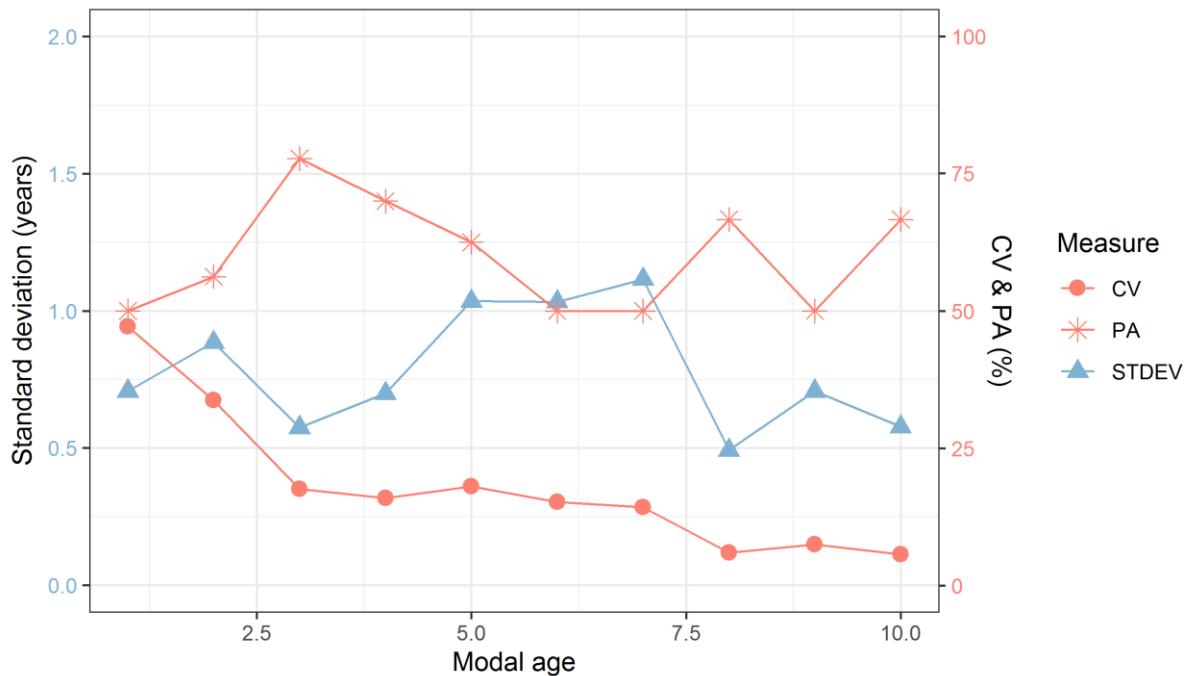

Figure 10.7.7: CV, PA and (STDEV (standard deviation) are plotted against modal age.

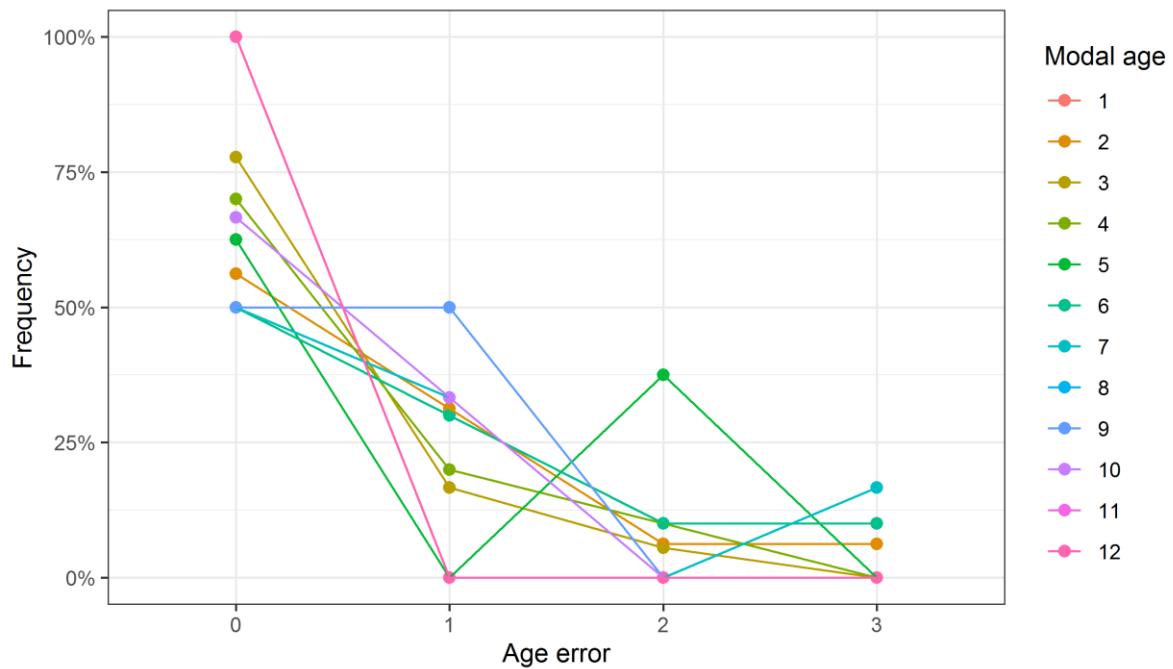

Figure 10.7.8: The distribution of the age reading errors in percentage by modal age as observed from the whole group of age readers in an age reading comparison to modal age. The achieved precision in age reading by MODAL age group is shown by the spread of the age readings errors. There appears to be no relative bias if the age reading errors are normally distributed. The distributions are skewed if relative bias occurs.

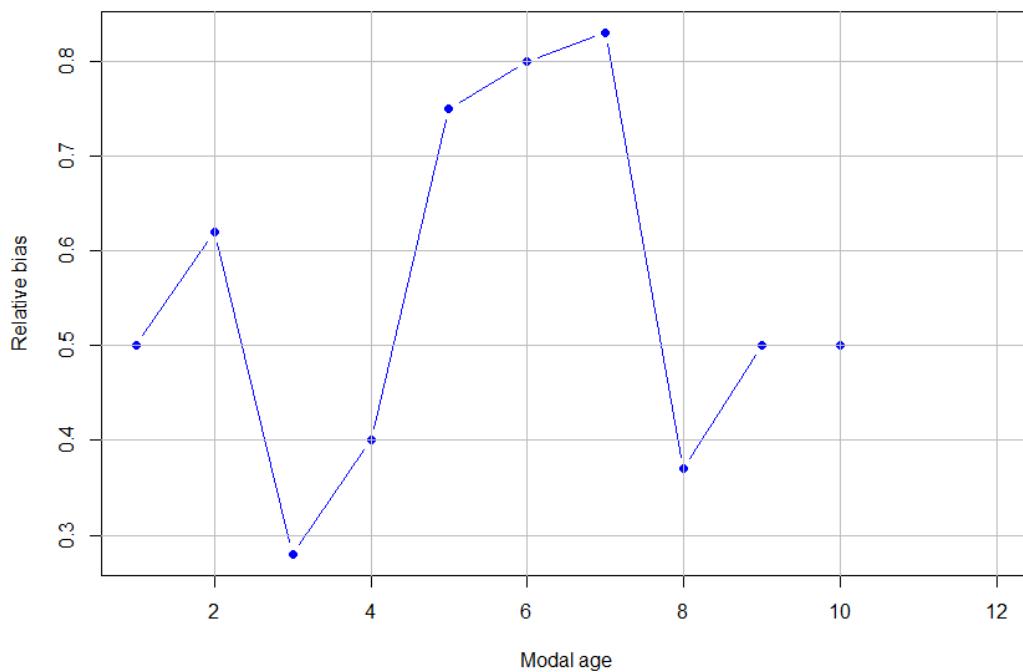

Figure 10.7.9: The relative bias by modal age as estimated by all age readers combined.

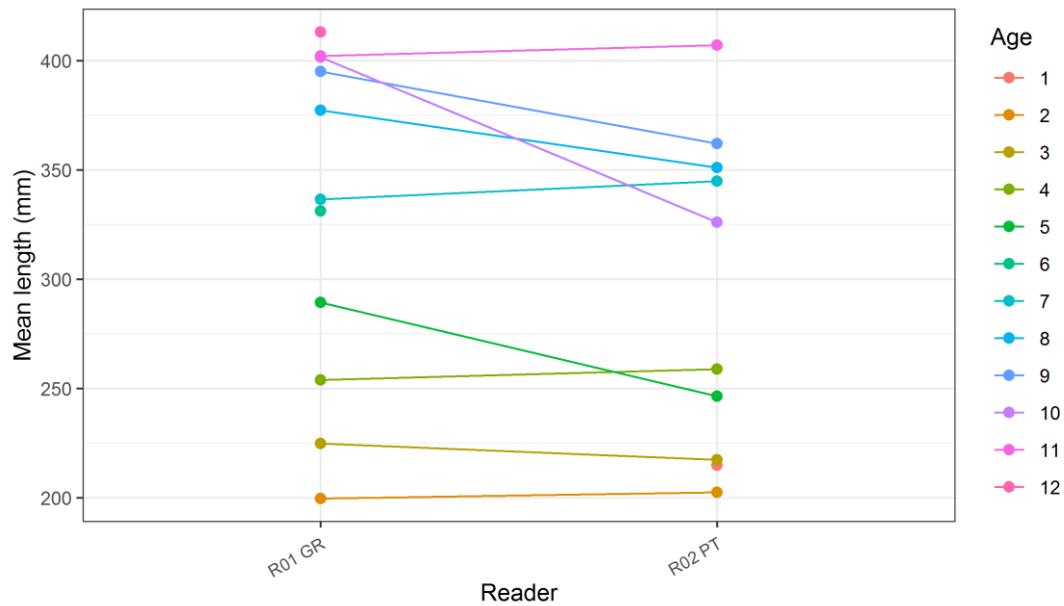

Figure 10.7.10: The mean length at age as estimated by each age reader.
