1 Introduction

Genus *Trachurus* belongs to the Family Carangidae and is composed by numerous medium-pelagic species with commercial interest, sustaining artisanal and industrial fisheries worldwide (Fischer et al., 1981). In the North-, Central-East Atlantic and the Mediterranean Sea, this group is mainly represented by *T. trachurus*, *T. mediterraneus* and *T. picturatus*, with different geographical distribution and abundance, although with quite overlapping among them depending on the area (Fig. 1).

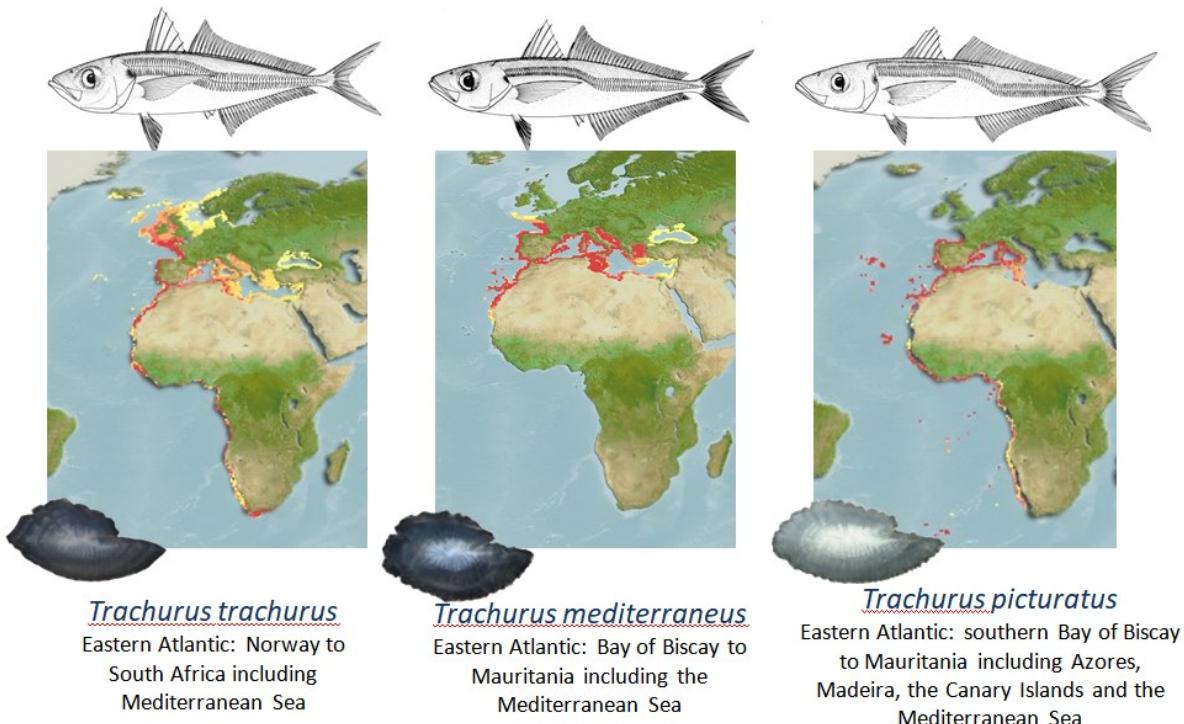

Figure 1. Geographical distribution of the *Trachurus* species addressed in the present otolith exchange (Froese and Pauly, 2022; Fischer et al., 1981)

The biological knowledge of these species is also variable and different among areas (ICES, 2018), but it is widely agreed that readability of the *Trachurus* otoliths is quite difficult and that there are regional differences, being the ageing interpretation more difficult in the southern areas of their distribution limits, where seasonal climate oscillations are lower. Due to age determination is essential in fish stock assessment to estimate the rates of mortalities and growth, in order to provide appropriate management advice, ageing procedures must be reliable. However, otolith preparation and age reading methods might differ considerably between countries, and to organize otolith exchanges on a regular basis and age reading workshops is recommended if serious problems are found, to agree and to update the criteria used among countries. With this aim, an expert group met in 1996 to agree common criteria in the ageing process of horse mackerel. This was the actual origin of the activities which led to the creation of the ICES WKARHOM (Workshop on Age reading of Horse Mackerel, Mediterranean Horse Mackerel and Blue Jack Mackerel (*Trachurus trachurus*, *T. mediterraneus* and *T. picturatus*) in 2012 (Table 1.1). Based on the results of last otolith exchange and the workshop in 2018, the Working Group on Biological Parameters (WGBIOP) identified the need for another exchange and age reading workshop on *Trachurus* species (ICES, 2020).

Table 1.1 Summary of the otolith exchanges and workshops on *Trachurus* species in the ICES framework.

Year	Exchange/ Workshop	Species	References
1996	Exchange	<i>T. trachurus</i>	-Report of the horse mackerel otolith workshop (ICES, 1999)
1999	Workshop		
2006	Both	<i>T. trachurus</i>	-Report of the Horse Mackerel Exchange and Workshop 2006 (Bolle et al., 2011)
2012	Both	<i>T. trachurus</i> <i>T. mediterraneus</i> <i>T. picturatus</i>	-Report of the WKARHOM1 (ICES, 2016)
2015	Both	<i>T. trachurus</i> <i>T. mediterraneus</i> <i>T. picturatus</i>	-Report of the Horse Mackerel, Mediterranean Horse Mackerel and Blue Jack Mackerel Otolith Exchange 2015 (Mahé et al., 2015) -Report of the WKARHOM2 (ICES, 2015)
2018	Both	<i>T. trachurus</i> <i>T. mediterraneus</i> <i>T. picturatus</i>	-Report of the WKARHOM3 (ICES, 2018)

The agreed ToR A for the workshop included the performance of previous otolith exchanges for the three species. The overall otolith Exchange was organized during 2021 (which finalized in February 2022), including 38 readers from 12 countries (including samples from the Atlantic Archipelagos of Madeira, Açores and The Canary Islands) interested on evaluating their ageing criteria and to inter-calibrate them with other laboratories/countries involved in ageing procedures along the geographical distribution of these species, both in the Atlantic Ocean and the Mediterranean Sea (Annex 1).

Readers were instructed to follow the WKARHOM3 schemes and protocols when completing the current otolith exchange annotations on SmartDots. Precision measures were analysed by species in order to evaluate the necessity of a 4th WKARHOM meeting, both for the total of the basic readers and the advanced ones.

2 Methods

All the laboratories participating in the Exchange contributed to the exchange with otolith pictures from their areas, following general instructions provided by the coordinators. Readings were carried out without information about individual length and readings were performed marking all the annual translucent rings and in addition edge type (Opaque / Translucent) was annotated.

The statistical analysis was carried out follows traditional methods where the level of accuracy compared to modal age was indicated by percentage agreement (PA) and bias tests, plots and the level of precision (i.e. the reproducibility of age estimates) was indicated by the coefficient of variation (CV). The tables and plots presented are from the Guus Eltink Excel sheet 'Age Reading Comparisons' (Eltink, 2000). Additional analyses as average percentage error (APE) and age error matrices (AEM's) were included; average percentage error (APE) and age error matrices (AEM's).

Percentage Agreement (PA)

The PA's are calculated as the ratio between the total number of age readings in agreement with modal age and the total number of age readings for that sample:

$$PA (\%) = \frac{n_{modalage}}{n_{total}} \times 100$$

These values are calculated per reader and modal age and also for all the readers per modal age and a weighted mean of the PA per reader.

Coefficient of Variation (CV)

The CV's were calculated as the ratio between the standard deviation (σ) and mean value (μ) per reader and modal age:

$$CV (\%) = \frac{\sigma}{\mu} \times 100$$

In the tables the CV of all readers combined per modal age and a weighted mean of the CV per reader are also added.

Average Percentage Error (APE)

APE was calculated based on the method outlined by Beamish and Fournier (1981). This method is not independent of fish age and thus provides a better estimate of precision. As the calculations of both CV and APE pose problems if the mean age is close to 0, all observations for which modal age was 0 were omitted from the CV and APE calculations.

The average percentage error is calculated per image as:

$$APE = \frac{100\%}{n} \sum_{i=1}^n \left| \frac{a_i - \bar{a}}{\bar{a}} \right|$$

where a_i is the age reading of reader i and \bar{a} is the mean of all readings from 1 to n .

Age error matrix (AEM)

Age error matrices (AEM) were produced following procedures outlined by WKSABCAL (ICES, 2014) where the matrix shows the proportion of each modal age mis-aged as other ages. The sum of each row is 1, which equals 100%. The age data was analysed twice, the first time all readers were included and the second time only the “advanced” readers were included. If a reader is “advanced” then they are considered well trained and they provide ages for stock assessment or similar purposes. When the AEM is compiled for assessment purposes it uses only those readers who provide age data for the stock assessment in that specific area.

2.1 Overview of samples and readers

Table 2.1: Overview of samples used for the otolith exchange of *Trachurus trachurus* (Event-ID 362). Otolith preparation: whole.

The relative bias is the difference between the mean age (per modal age per reader) and modal age. As for the previous tables, a combined bias for all readers and weighted means are calculated (Table 3.4).

Table 3.4: Relative bias per modal age per reader, the relative bias of all readers combined per modal age and a weighted mean of the relative bias per reader.

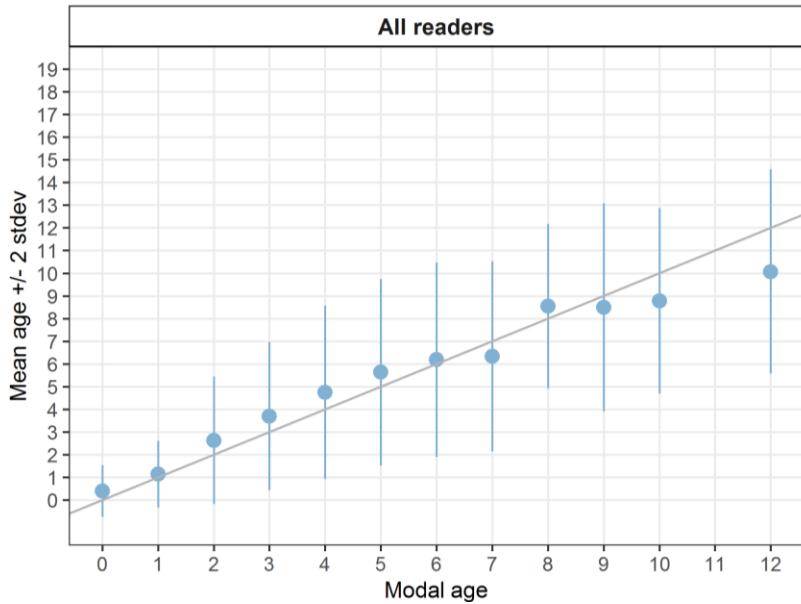

Figure 3.1: Age bias plot for all readers. Mean age recorded +/- 2 stdev of each reader and all readers combined are plotted against modal age. The estimated mean age corresponds to modal age, if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

For each pair that is being compared, the differences between the readings per image are found and the frequency of each occurring difference is obtained. A rank value is calculated for the positive and the negative differences (R+ and R- in the Guus Eltink sheet). The value with the smallest rank is then used to calculate a z-value that determines the level of bias (not clear from Guus Eltink sheet how the equations are defined).

Table 3.5: Inter reader bias test. The Inter-reader bias test gives probability of bias between readers and with modal age. - = no sign of bias ($p>0.05$), * = possibility of bias ($0.01 < p < 0.05$), ** = certainty of bias ($p < 0.01$)

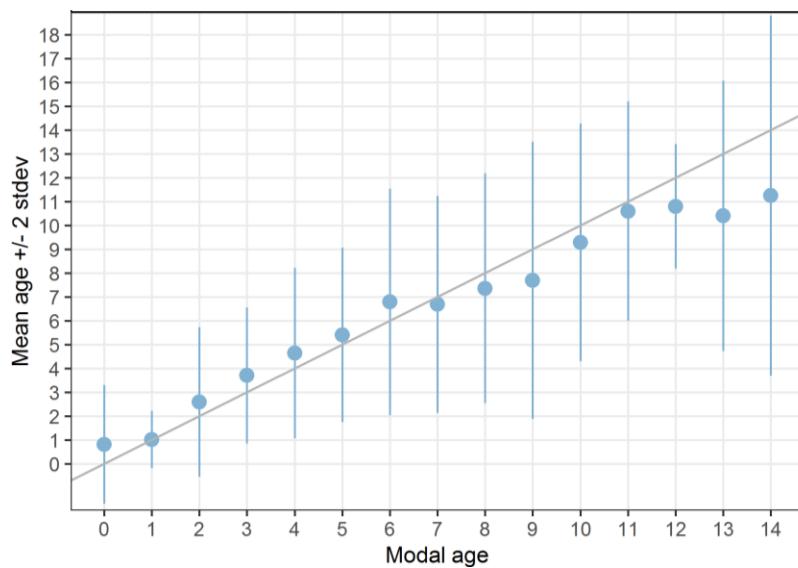

Figure 3.2: Age bias plot for advanced readers.

Age error matrices are calculated per area and only based on the age readings of the advanced readers.

Table 3.10: Age error matrix (AEM) for whole otolith readings. The AEM shows the proportional distribution of age readings for each modal age. Age column should sum to one but due to rounding there might be small deviations in some cases. Only advanced readers are used for calculating the AEM.

3.1.2 Sliced otoliths

3.1.2.1 All readers

The weighted average percentage agreement based on modal ages for all readers is 46 %, with a weighted average CV of 26 % and an APE of 18 % (Tables 3.12 - 3.14).

Table 3.12: Coefficient of Variation (CV, %) per modal age and reader, the CV of all readers combined per modal age and a weighted mean of the CV per reader.

The percentage agreement per reader per modal age tells how large part of the readings that are equal to the modal age. The weighted mean including at the bottom of the table is weighted according to number of age readings.

Table 3.13: Percentage agreement (PA, %) per modal age and reader, the PA of all readers combined per modal age and a weighted mean of the PA per reader.

The relative bias is the difference between the mean age (per modal age per reader) and modal age. As for the previous tables, a combined bias for all readers and weighted means are calculated (Table 3.14).

Table 3.14: Relative bias per modal age per reader, the relative bias of all readers combined per modal age and a weighted mean of the relative bias per reader.

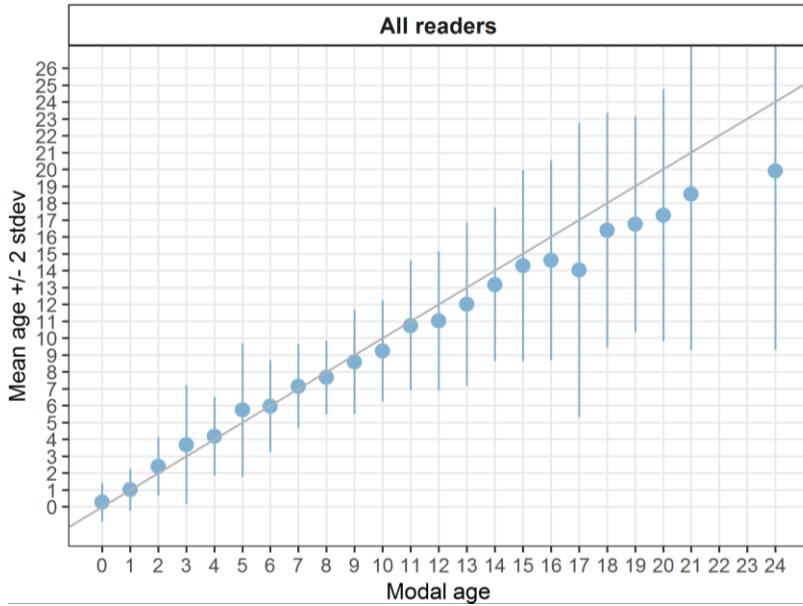

Figure 3.3: Age bias plot for all readers. Mean age recorded $+/- 2$ stdev of each reader and all readers combined are plotted against modal age. The estimated mean age corresponds to modal age, if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

For each pair that is being compared, the differences between the readings per image are found and the frequency of each occurring difference is obtained. A rank value is calculated for the positive and the negative differences ($R+$ and $R-$ in the Guus Eltink sheet). The value with the smallest rank is then used to calculate a z-value that determines the level of bias (not clear from Guus Eltink sheet how the equations are defined).

Table 3.15: Inter reader bias test. The Inter-reader bias test gives probability of bias between readers and with modal age. - = no sign of bias ($p>0.05$), * = possibility of bias ($0.01 < p < 0.05$), ** = certainty of bias ($p < 0.01$)

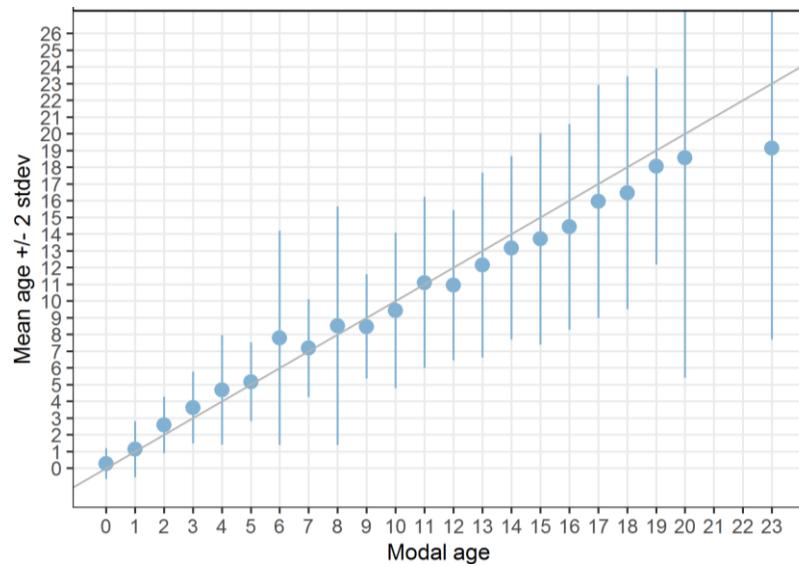

Figure 3.4: Age bias plot for advanced readers.

Age error matrices are calculated per area and only based on the age readings of the advanced readers.

Table 3.20: Age error matrix (AEM) for sliced otoliths. The AEM shows the proportional distribution of age readings for each modal age. Age column should sum to one but due to rounding there might be small deviations in some cases. Only advanced readers are used for calculating the AEM.

3.2 Results *Trachurus mediterraneus* (Event-ID 388)

3.2.1 All readers

The weighted average percentage agreement based on modal ages for all readers is 51 %, with a weighted average CV of 42 % and an APE of 30 % (Tables 3.22 - 3.23).

Table 3.22: Coefficient of Variation (CV, %) per modal age and reader, the CV of all readers combined per modal age and a weighted mean of the CV per reader.

Weighted Mean	44	40	32	27	30	38	24	37	27	39	36	29	26	39	42

The percentage agreement per reader per modal age tells how large part of the readings that are equal to the modal age. The weighted mean including at the bottom of the table is weighted according to number of age readings.

Table 3.23: Percentage agreement (PA, %) per modal age and reader, the PA of all readers combined per modal age and a weighted mean of the PA per reader.

The relative bias is the difference between the mean age (per modal age per reader) and modal age. As for the previous tables, a combined bias for all readers and weighted means are calculated (Table 3.24).

Table 3.24: Relative bias per modal age per reader, the relative bias of all readers combined per modal age and a weighted mean of the relative bias per reader.

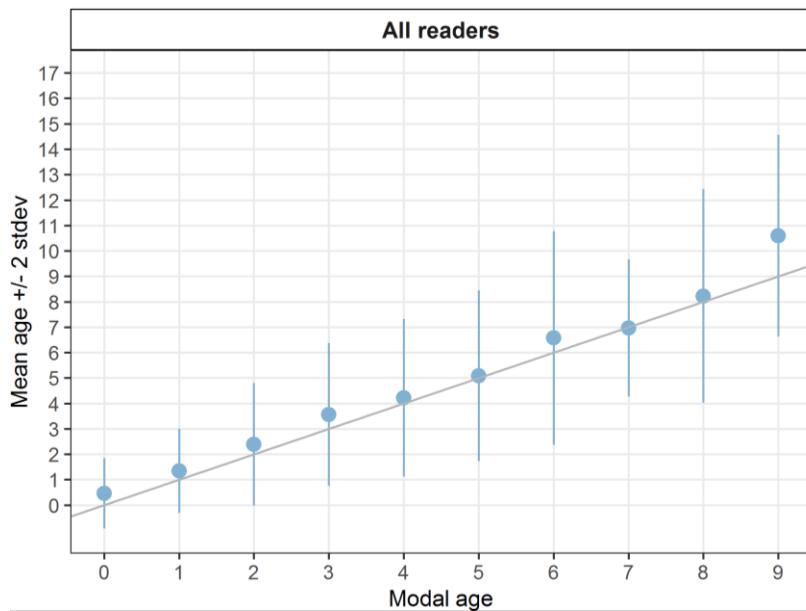

Figure 3.5: Age bias plot for all readers. Mean age recorded +/- 2 stdev of each reader and all readers combined are plotted against modal age. The estimated mean age corresponds to modal age, if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

For each pair that is being compared, the differences between the readings per image are found and the frequency of each occurring difference is obtained. A rank value is calculated for the positive and the negative differences (R+ and R- in the Guus Eltink sheet). The value with the smallest rank is then used to calculate a z-value that determines the level of bias (not clear from Guus Eltink sheet how the equations are defined).

Table 3.25: Inter reader bias test. The Inter-reader bias test gives probability of bias between readers and with modal age.

- = no sign of bias ($p>0.05$), * = possibility of bias ($0.01 < p < 0.05$), ** = certainty of bias ($p<0.01$)

3.3 Results *Trachurus picturatus* (Event-ID 387)

3.3.1 All readers

The weighted average percentage agreement based on modal ages for all readers is 54 %, with a weighted average CV of 54 % and an APE of 36 % (Tables 3.32 - 3.33).

Table 3.32: Coefficient of Variation (CV, %) per modal age and reader, the CV of all readers combined per modal age and a weighted mean of the CV per reader.

The percentage agreement per reader per modal age tells how large part of the readings that are equal to the modal age. The weighted mean including at the bottom of the table is weighted according to number of age readings.

Table 3.33: Percentage agreement (PA, %) per modal age and reader, the PA of all readers combined per modal age and a weighted mean of the PA per reader.

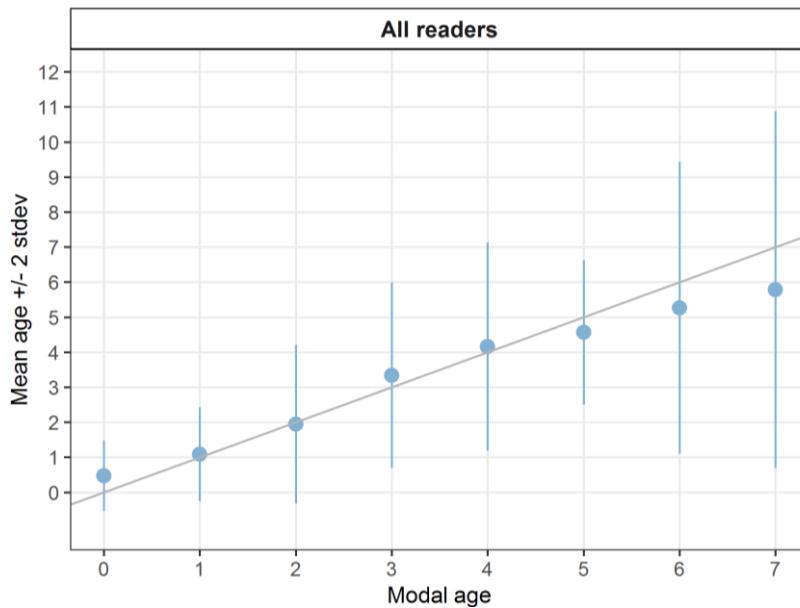

Figure 3.7: Age bias plot for all readers. Mean age recorded +/- 2 stdev of each reader and all readers combined are plotted against modal age. The estimated mean age corresponds to modal age, if the estimated mean age is on the 1:1 equilibrium line (solid line). Relative bias is the age difference between estimated mean age and modal age.

For each pair that is being compared, the differences between the readings per image are found and the frequency of each occurring difference is obtained. A rank value is calculated for the positive and the negative differences (R+ and R- in the Guus Eltink sheet). The value with the smallest rank is then used to calculate a z-value that determines the level of bias (not clear from Guus Eltink sheet how the equations are defined).

Table 3.35: Inter reader bias test. The Inter-reader bias test gives probability of bias between readers and with modal age.

- = no sign of bias ($p>0.05$), * = possibility of bias ($0.01 < p < 0.05$), ** = certainty of bias ($p<0.01$)

3.3.2 Advanced readers

These results were not included in the report because only one reader was considered as an expert and comparison inter-readers was not possible.

3.4 Discussion

Based on the recommendations provided in the previous WKARHOM meetings, it was of great importance to use the same magnification when taking photos for the same “otolith set”, to be able to compare size and partial *annuli* radii. It was a source of age determination error (even intra-reader) repeatedly reported. However, the use of different magnitudes for pictures taken for the some “otolith sets” was observed.

The axis selected by coordinators for annotating each annulus was not always the preferred one that readers had chosen to mark them.

The assignment of the edge type constituted a critical point highlighted by some readers, due to its not easy recognition.

Regarding the Otolith Growth Analysis, although clear instructions were provided, some readers did not mark annuli at the end of the translucent ring. Therefore, distance measures and the subsequent analyses obtained using these data were not reliable.

Another problem was the low quality of some images, with low illumination or blurry, what should be carefully awarded when taking the photos.

Coordinators want to notice that some readers asked for the fish length data related to the otolith images, what has been pointed to be avoided during the age interpretation.

Finally, some issues were encountered with SmartDots outputs:

- when we use one strata for all samples for evaluating two preparation methods program does not work.
- plot of average distance from the centre to the winter rings is not divided into the two preparation methods making it unreadable.
- “Figure X: The relative bias by modal age as estimated by all age readers combined” is incorrect .
- Inability to edit files (e.g. image name or completely delete a file without enter all or part of filename) directly in the “Edit Event” page.

3.5 Conclusion

The exchange results showed a low value of percentage of agreement (PA) between 46.0 % and 54.0 % for the three *Trachurus* species. For all readers, the CV for *T. trachurus* was 45.0% for whole otoliths and a much lower value of 26.0% for sliced otoliths; for *T. mediterraneus* CV was 42.0 % and for *T. picturatus* it was 54.0 %.

Recommendations produced in the last workshop do not seem to have been considered by the different laboratories, both the ones related to the species assessment and the ones recently interested on the beginner readers training.

Lower agreement among readers was related to interpretation and ageing difficulties for older species and for the presence of multiple rings, mostly in *T. trachurus*. For age group 0 and 1, disagreement was correlated to the recognition of the first winter ring. In addition, lower agreement was noticed in sample with poor quality image.

A workshop to again revise and agree the ageing criteria by the readers in charge is necessary.

Carbonara. 2015. *Report of the Horse Mackerel, Mediterranean Horse Mackerel and Blue Jack Mackerel (*Trachurus trachurus*, *T. mediterraneus* and *T. picturatus*) Otolith Exchange 2015*. IFREMER.

5 Annex 1. List of participants

Table 5.1: Participants list. Reader details: Expertise level is defined as *advanced* (Ad) if reader provides age data for assessment purposes, or *basic* (B) if not

Participant Surname, Name	Country	Institution	Expertise		
			<i>T. trachurus</i>	<i>T. mediterraneus</i>	<i>T. picturatus</i>
Acosta, Jesús	Spain	IEO, CSIC-Málaga	B	Ad	B
Anastasopoulou, Karina	Greece	HCMR	B	B	B
Bellodi, Andrea	Italy	UNICA	B	B	B
Casciaro, Loredana	Italy	COISPA	B	Ad	B
Cruz, Renato	Portugal	SGMP, DRP-Açores			B
Defruit, Geoffrey	France	IFREMER	B		
Diaz, Justine	Norway	IMR	B		
Dijkman, André	Netherlands	IMARES	Ad		
Dimitriadis, Giannis	Greece	FRI	B		
Dueñas, Clara	Spain	IEO, CSIC-Santander	Ad	B	B
El Habouz, Haou	Morocco	INRH	B		
Felicio, Maria	Portugal	IPMA	B	B	B
Ferreira, Maria João	Portugal	IPMA	Ad	B	B
Hemken, Gitta	Germany	Thünen Inst. SF	B		
Hernández, Eva	Spain	IEO, CSIC-Canarias			B
Jurado-Ruzafa, Alba	Spain	IEO, CSIC-Canarias			Ad
Legaki, Aglaia	Greece	HCMR	B	B	B
López, Eduardo	Spain	IEO, CSIC-Canarias	Ad	B	B
Maneiro, Iria	Spain	IEO, CSIC-Santander	B	B	B
Massaro, Andrea	Italy	APLYSIA	Ad	Ad	B
Meissner, Timo	Germany	Thünen Inst. SF	B		
Mullins, Eugene	Ireland	Marine Institute	Ad		
Nikiforidou, Vasiliki	Greece	HCMR	B	B	B
Pesci, Paola	Italy	UNICA	B	B	B
Rico, Iñaki	Spain	AZTI	B		
Russo, Loredana	Italy	CIBM	B		
Sioulas, Thanasis	Greece	FRI			B
Telliez, Solene	France	IFREMER	B		
Tonheim, Susanne	Norway	IMR	B		
Valtierra, Javier	Spain	IEO, CSIC-Vigo	B		

6 Annex 3. Additional results

6.1 Results *T. trachurus* (Event-ID 362)

6.1.1 Whole otoliths, all readers

Data Overview

Table 6.1: Summary of statistics; PA (%), CV (%) and APE (%).

CV	PA	APE
44 %	47 %	31 %

Table 6.2: Data overview including modal age and statistics per sample.

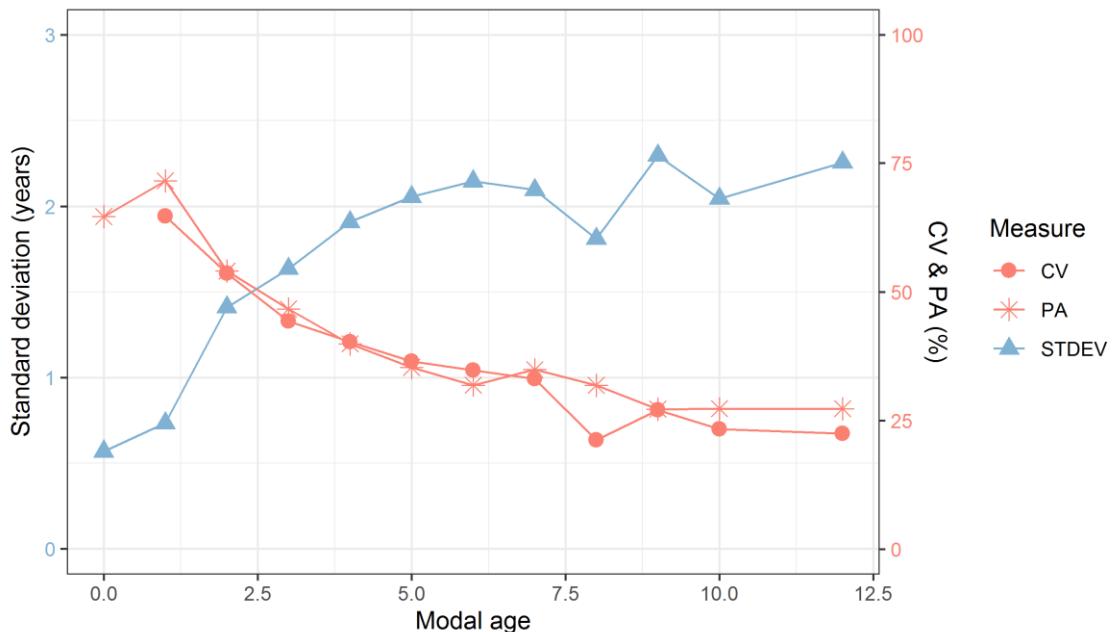

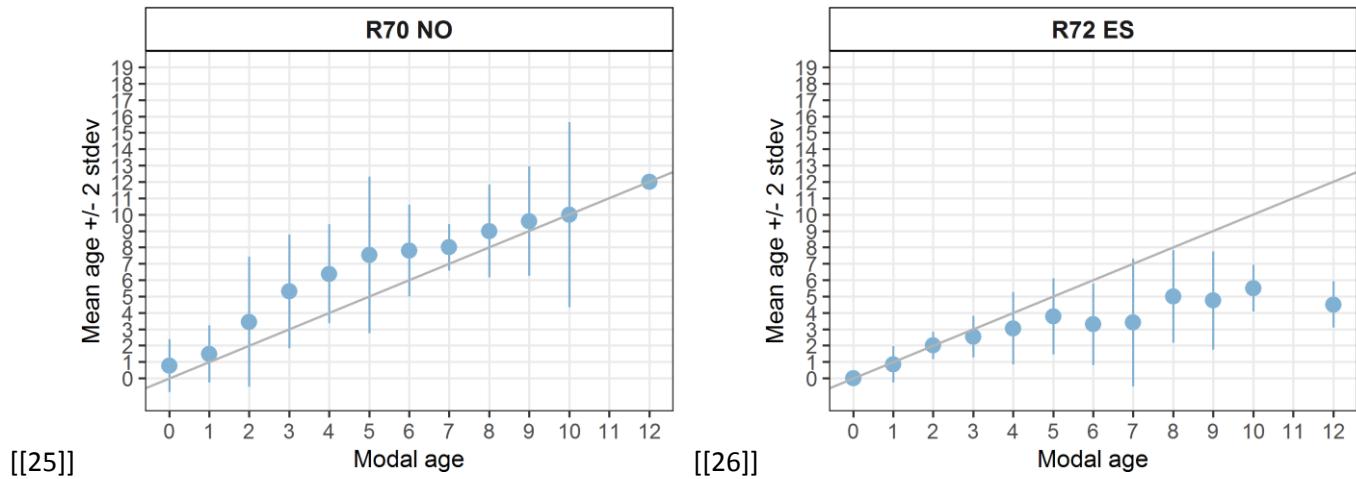

Figure 6.1: CV, PA and STDEV (standard deviation) are plotted against modal age

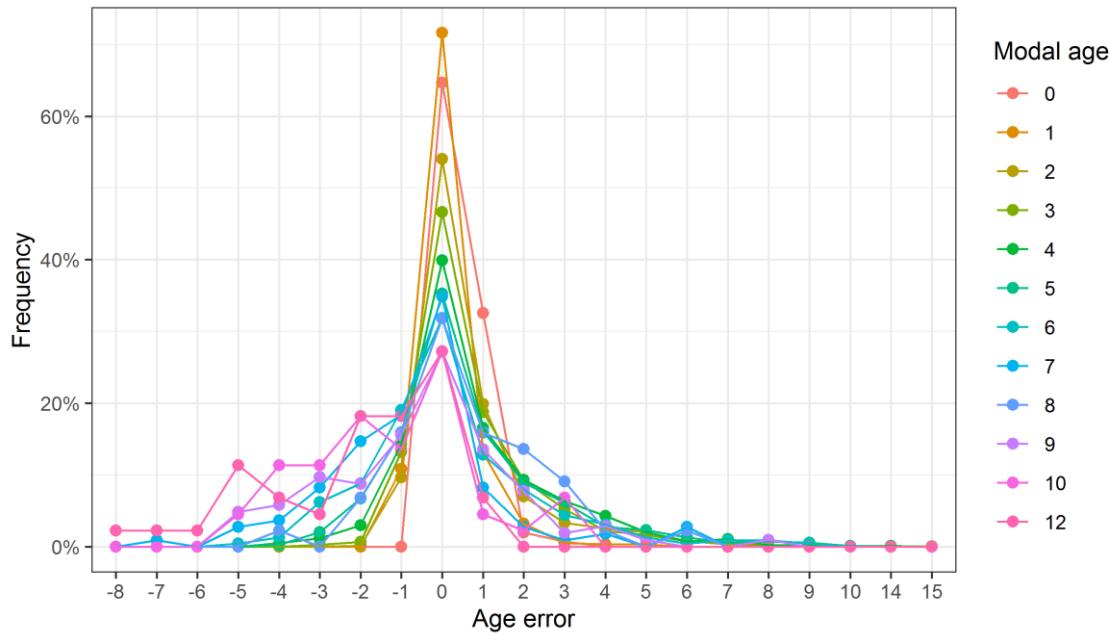

Figure 6.2: The distribution of the age reading errors in percentage by modal age as observed from the whole group of age readers in an age reading comparison to modal age. The achieved precision in age reading by MODAL age group is shown by the spread of the age readings errors. There appears to be no relative bias, if the age reading errors are normally distributed. The distributions are skewed, if relative bias occurs.

6.1.2 Whole otoliths, advanced readers

Data Overview

17	0	1	0	0	0	0
Total	219	250	248	249	241	98

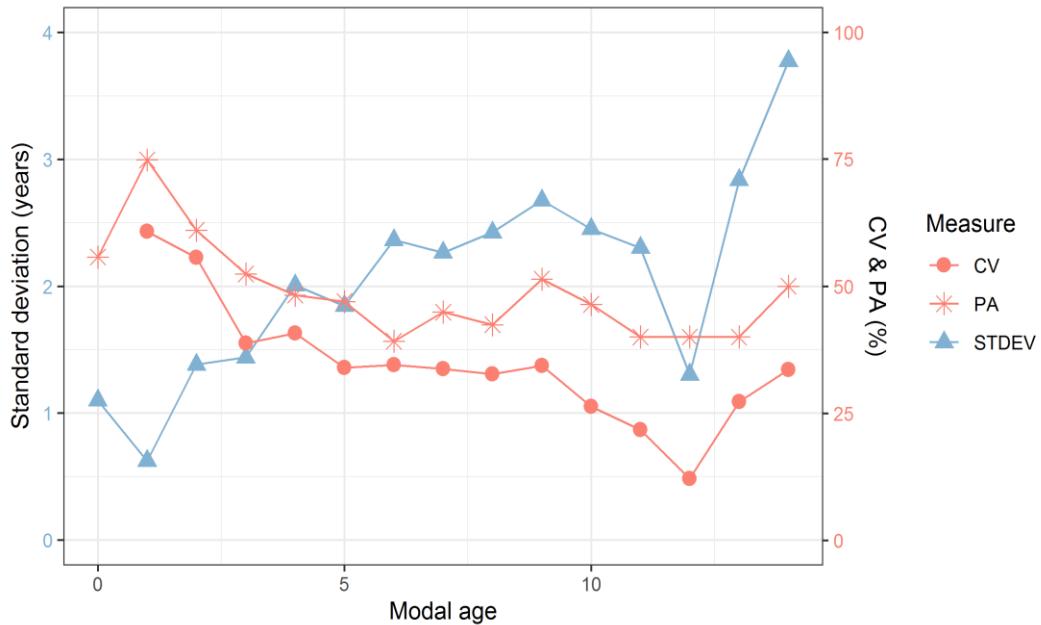

Figure 6.3: CV, PA and (STDEV (standard deviation) are plotted against modal age

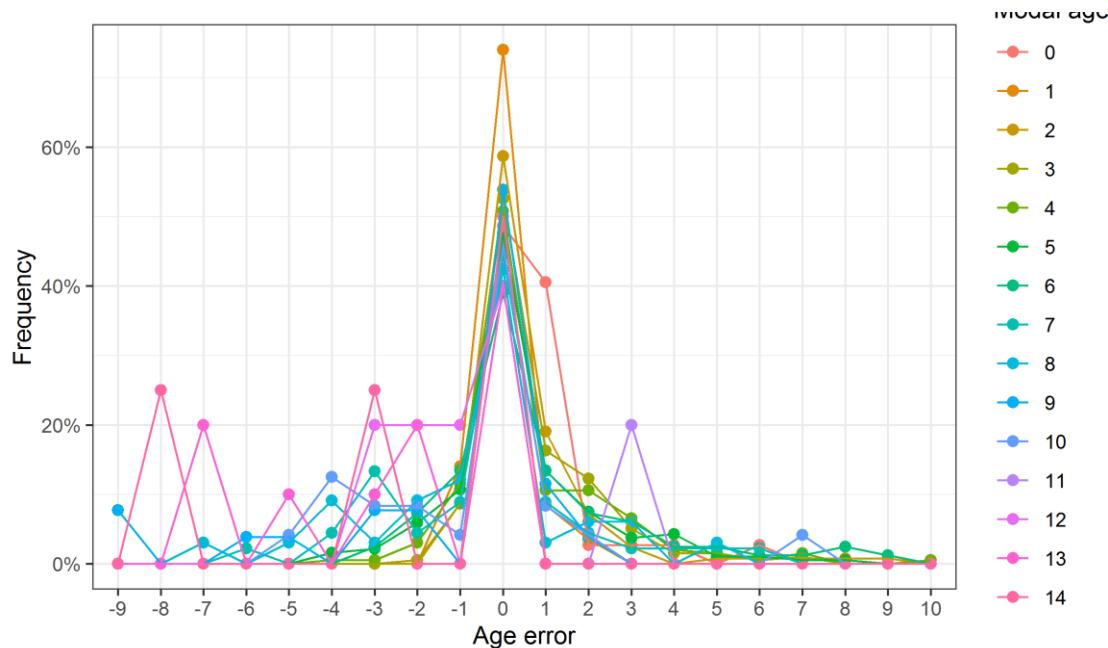

Figure 6.4: The distribution of the age reading errors in percentage by modal age as observed from the whole group of age readers in an age reading comparison to modal age. The achieved precision in age reading by MODAL age group is shown by the spread of the age readings errors. There appears to be no relative bias, if the age reading errors are normally distributed. The distributions are skewed, if relative bias occurs.

6.1.3 Sliced otoliths, all readers

Data Overview

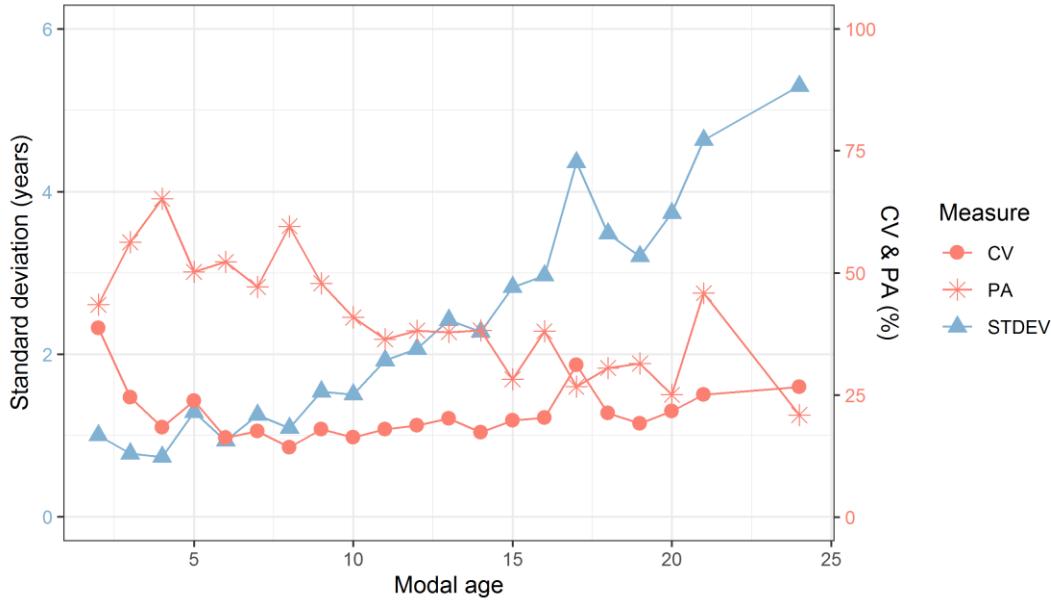

Figure 6.5: CV, PA and STDEV (standard deviation) are plotted against modal age

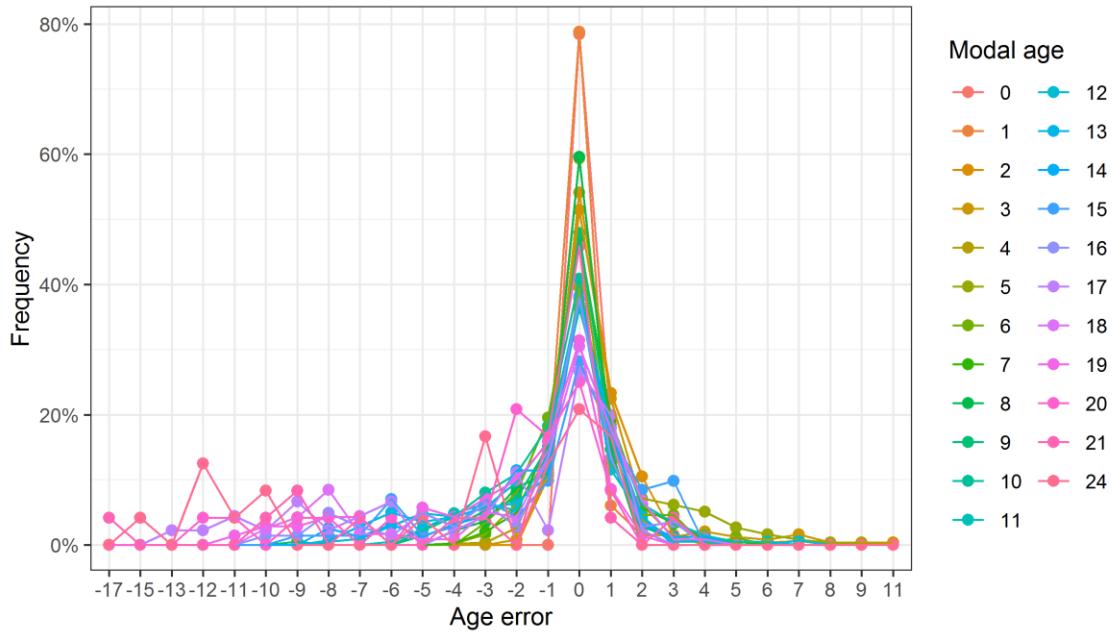

Figure 6.6: The distribution of the age reading errors in percentage by modal age group as observed from the whole group of age readers in an age reading comparison to modal age. The achieved precision in age reading by MODAL age group is shown by the spread of the age readings errors. There appears to be no relative bias, if the age reading errors are normally distributed. The distributions are skewed, if relative bias occurs.

6.1.4 Sliced otoliths, advanced readers

All samples included

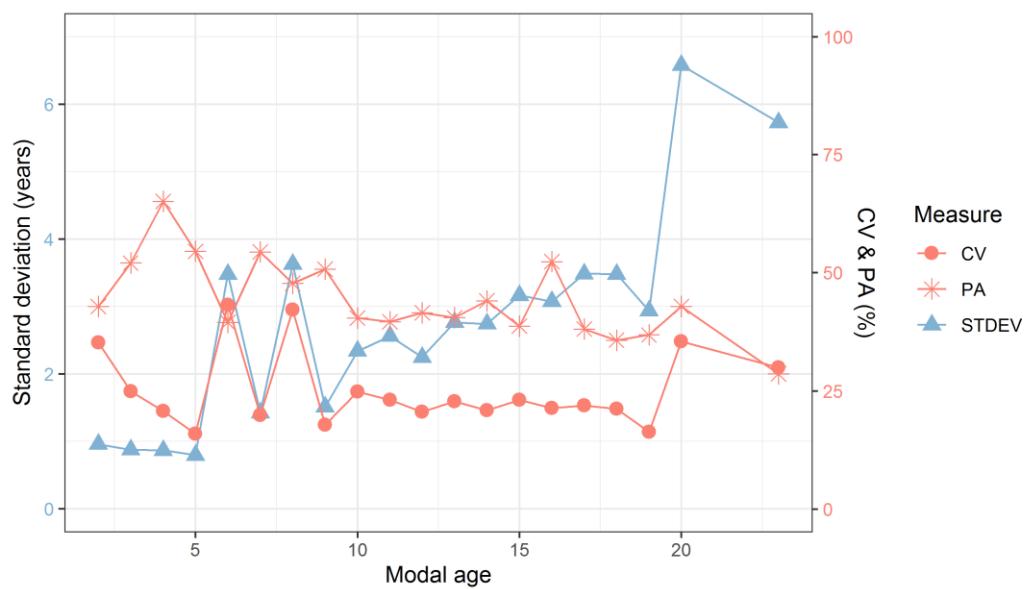

Figure 6.7: CV, PA and STDEV (standard deviation) are plotted against modal age

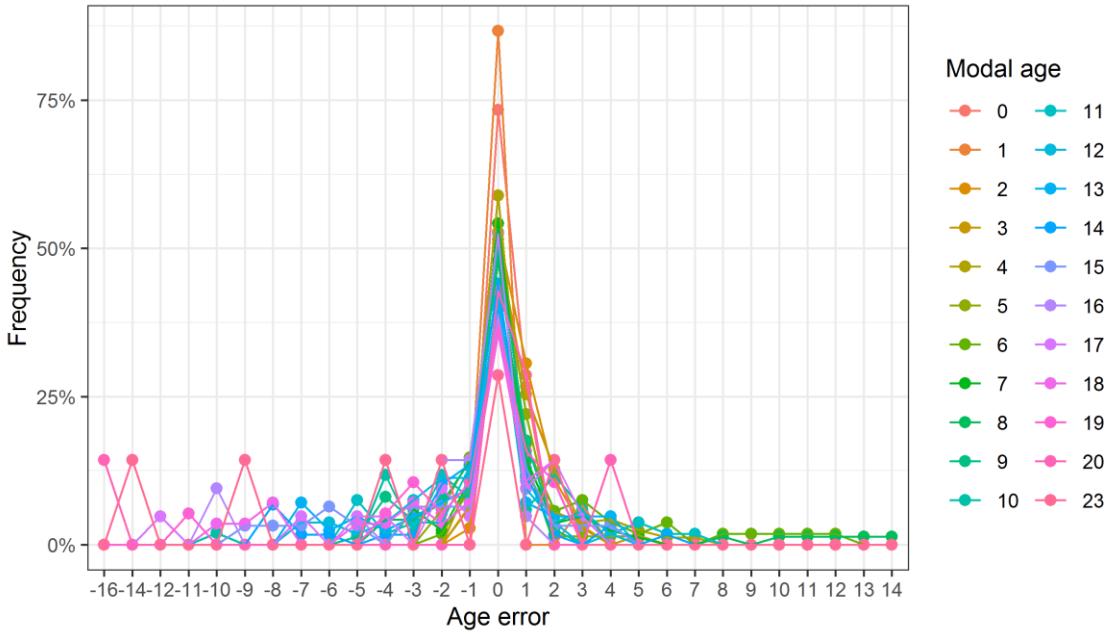

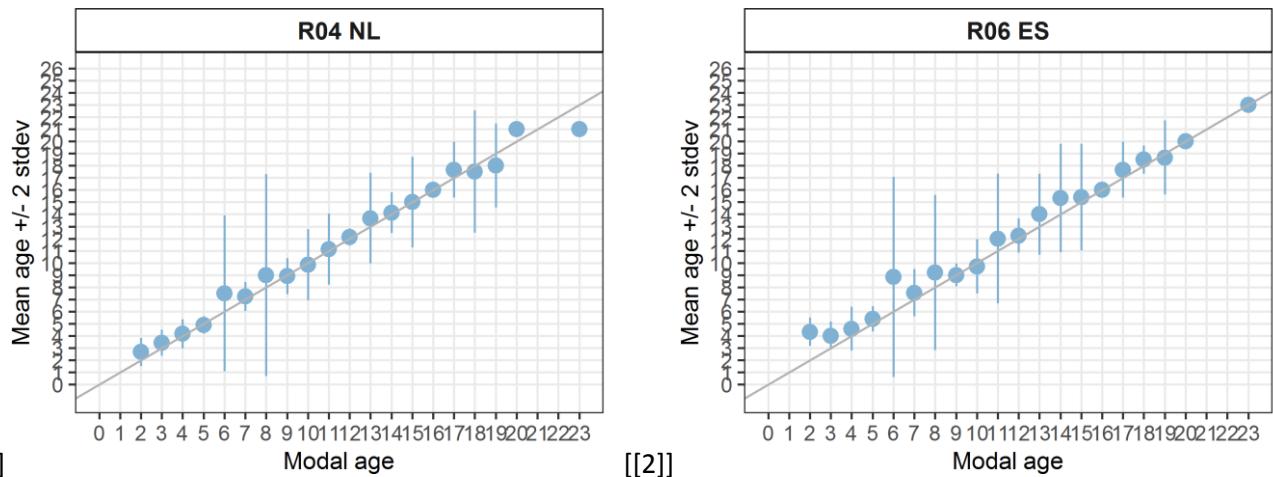

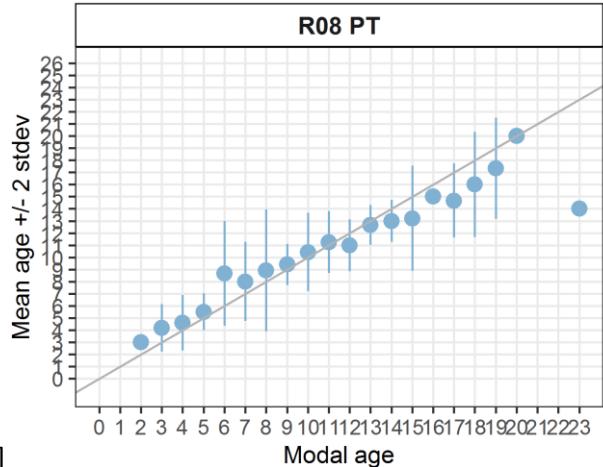

Figure 6.8: The distribution of the age reading errors in percentage by modal age as observed from the whole group of age readers in an age reading comparison to modal age. The achieved precision in age reading by MODAL age group is shown by the spread of the age readings errors. There appears to be no relative bias, if the age reading errors are normally distributed. The distributions are skewed, if relative bias occurs.

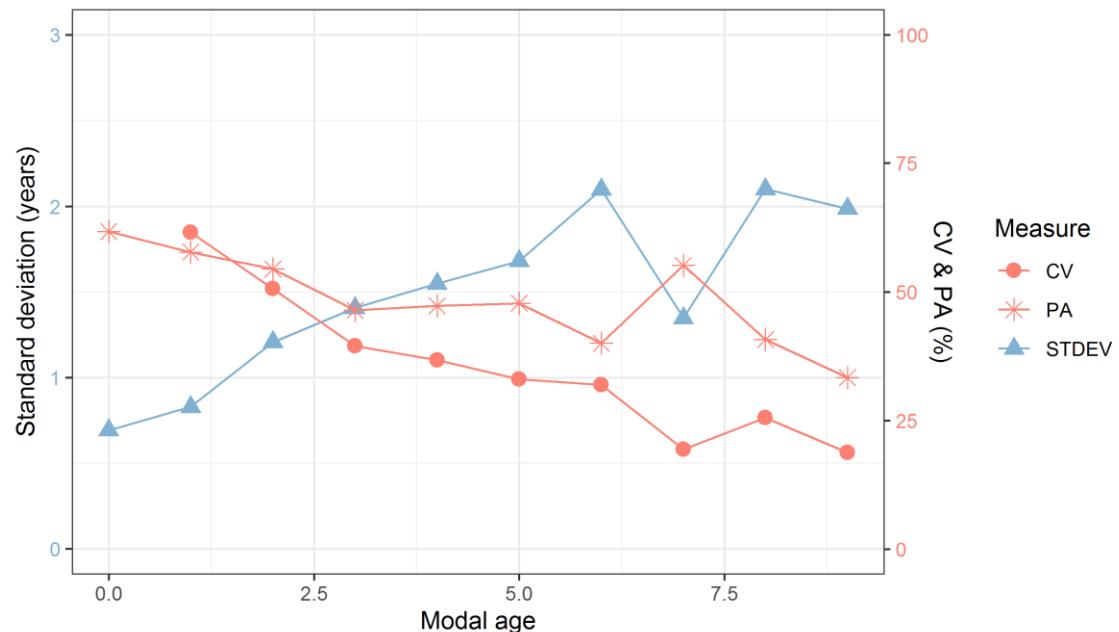

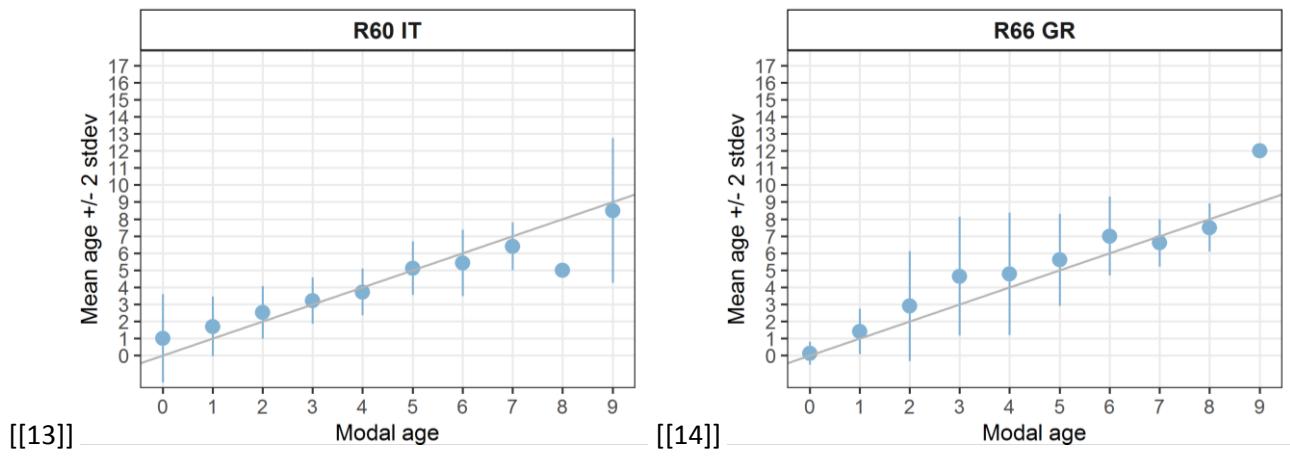

Figure 6.9: CV, PA and (STDEV (standard deviation) are plotted against modal age

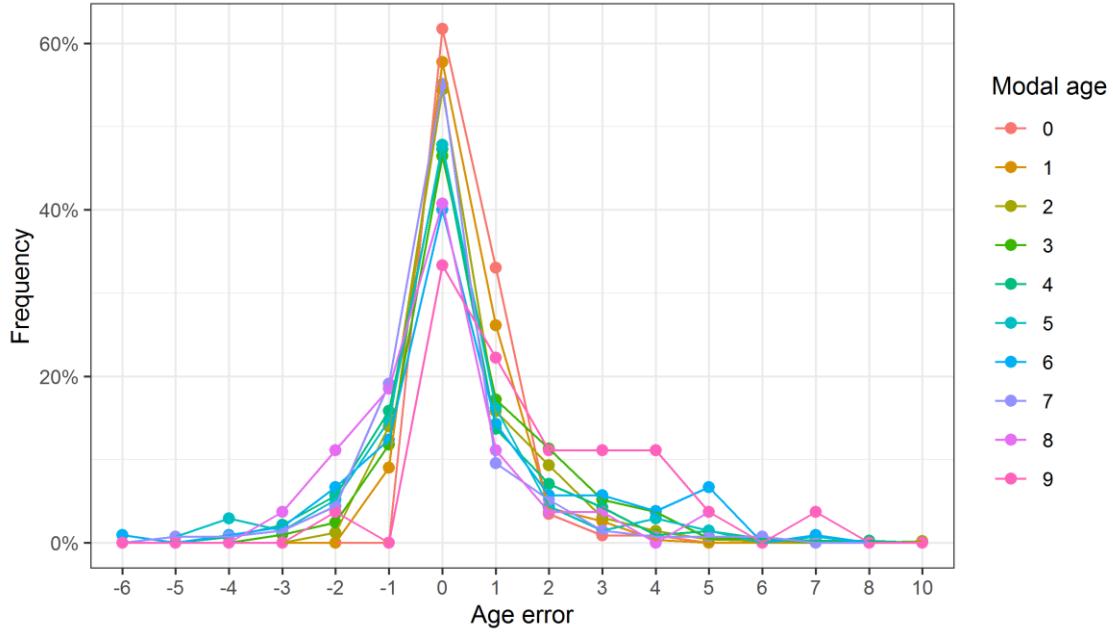

Figure 6.10: The distribution of the age reading errors in percentage by modal age as observed from the whole group of age readers in an age reading comparison to modal age. The achieved precision in age reading by MODAL age group is shown by the spread of the age readings errors. There appears to be no relative bias, if the age reading errors are normally distributed. The distributions are skewed, if relative bias occurs.

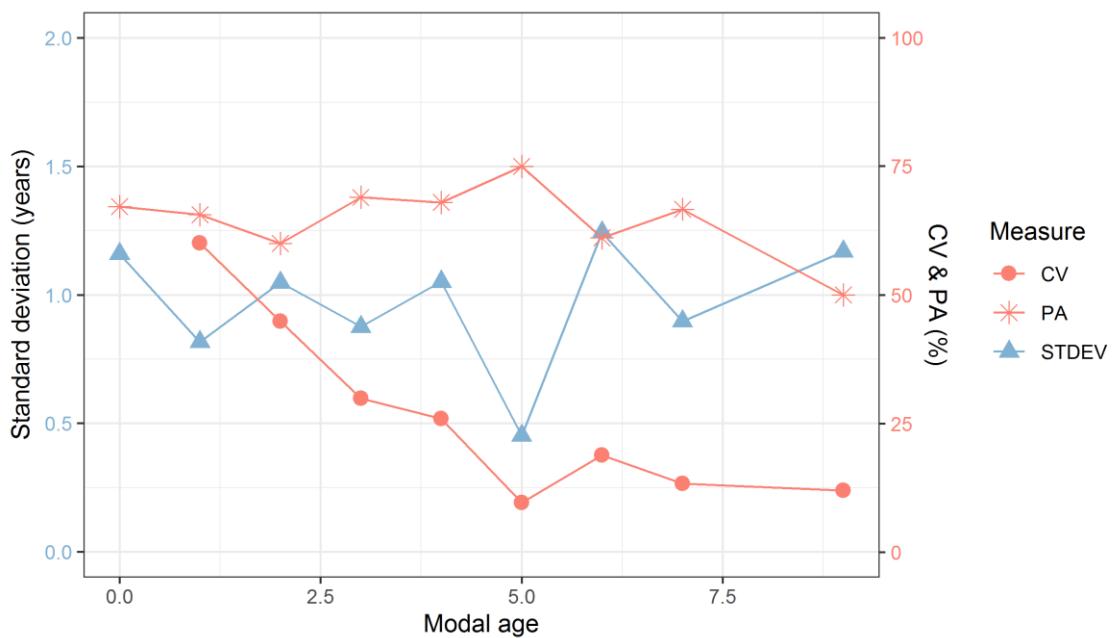

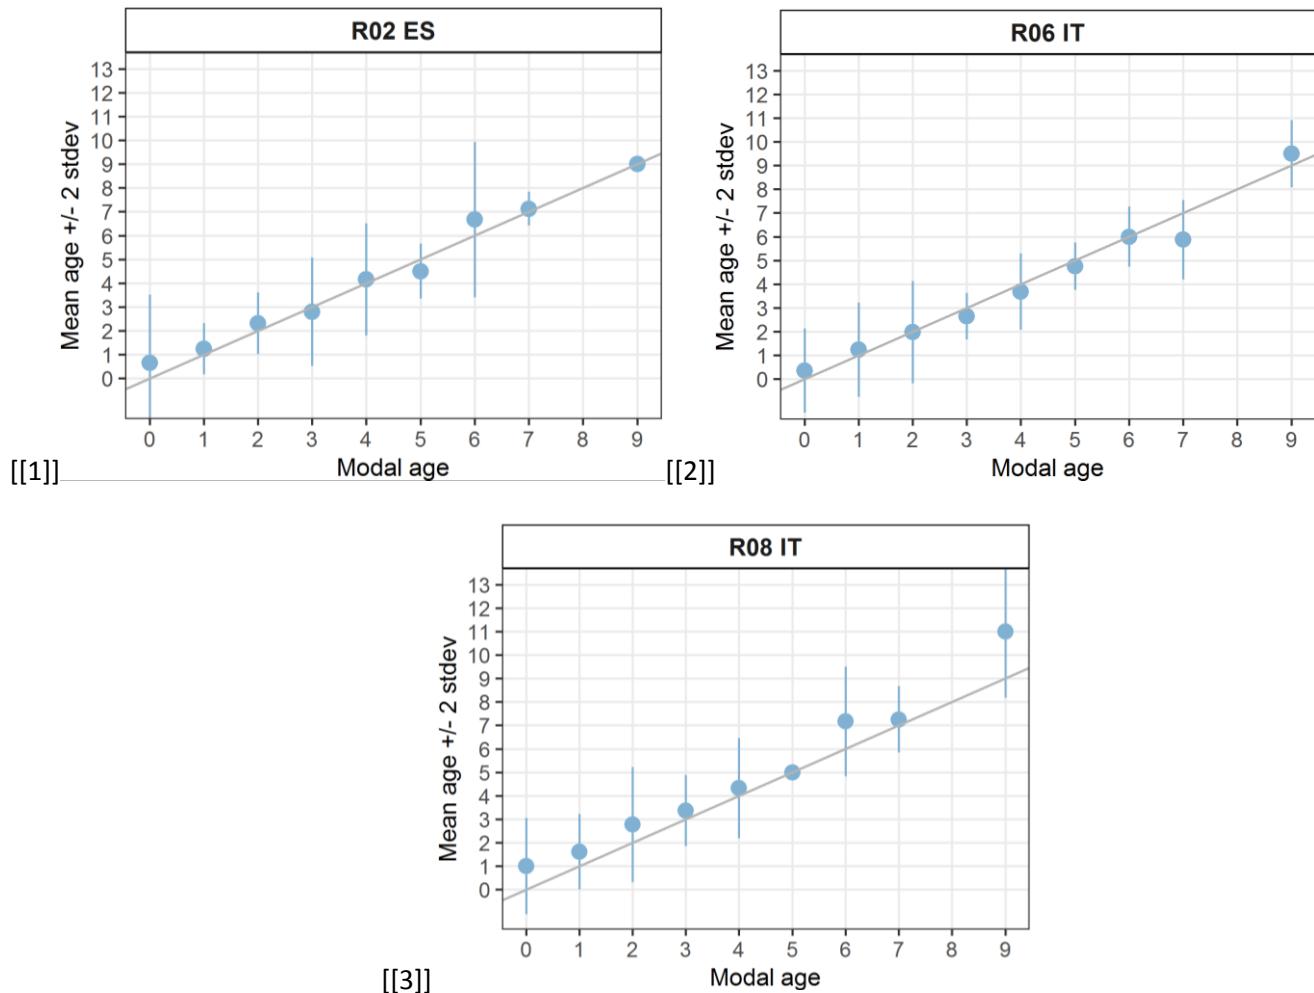

Figure 6.11: CV, PA and (STDEV (standard deviation) are plotted against modal age

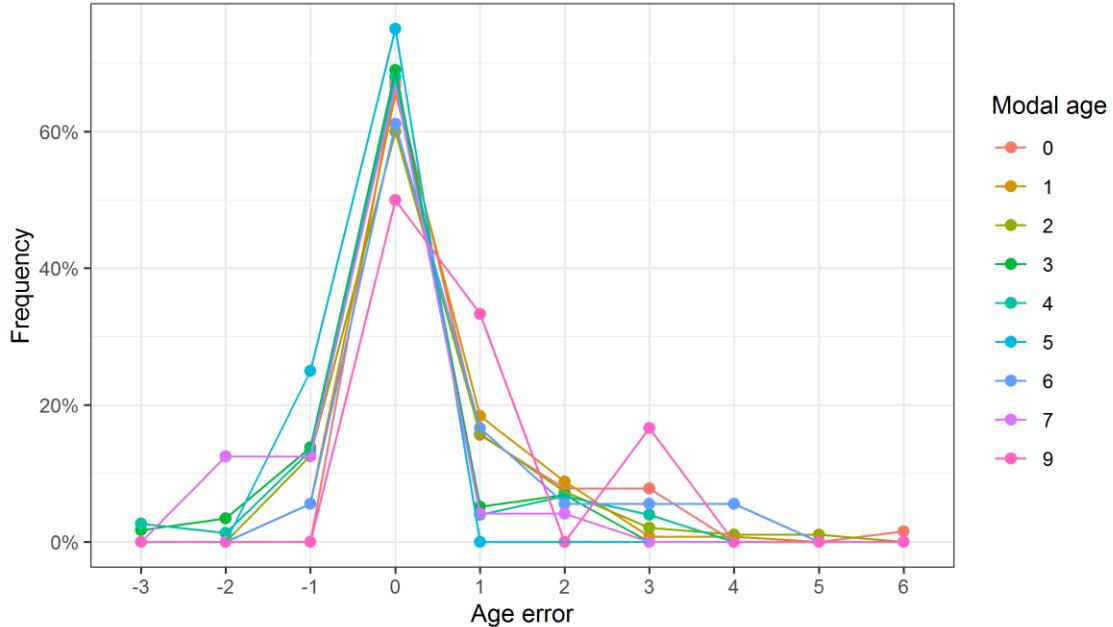

Figure 6.12: The distribution of the age reading errors in percentage by modal age as observed from the whole group of age readers in an age reading comparison to modal age. The achieved precision in age reading by MODAL age group is shown by the spread of the age readings errors. There appears to be no relative bias, if the age reading errors are normally distributed. The distributions are skewed, if relative bias occurs.

6.3 Results *T. picturatus* (Event-ID 387)

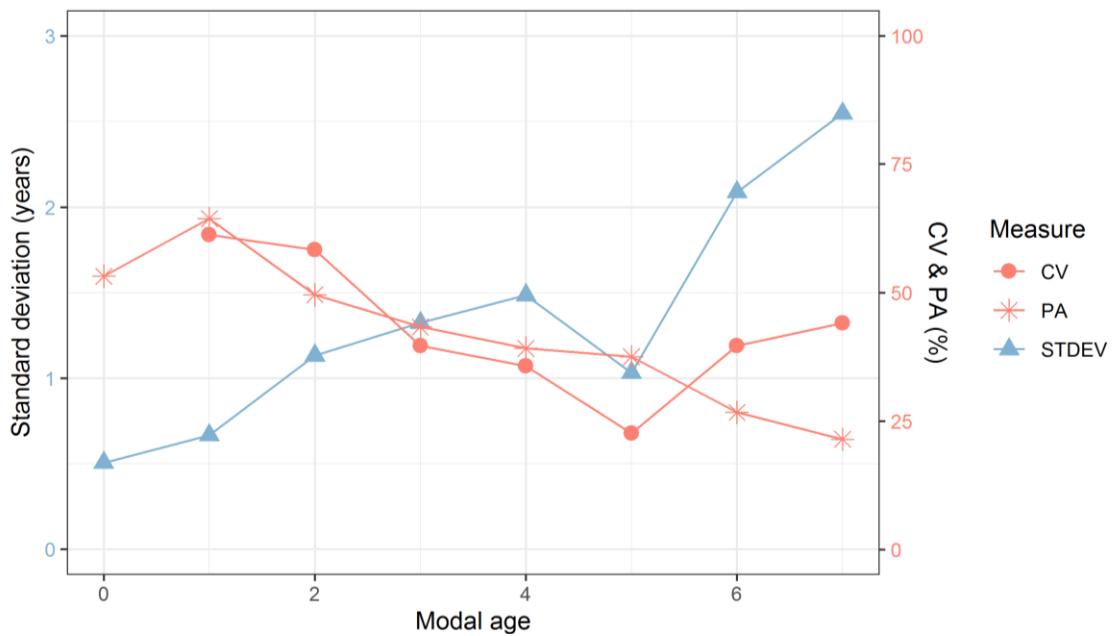

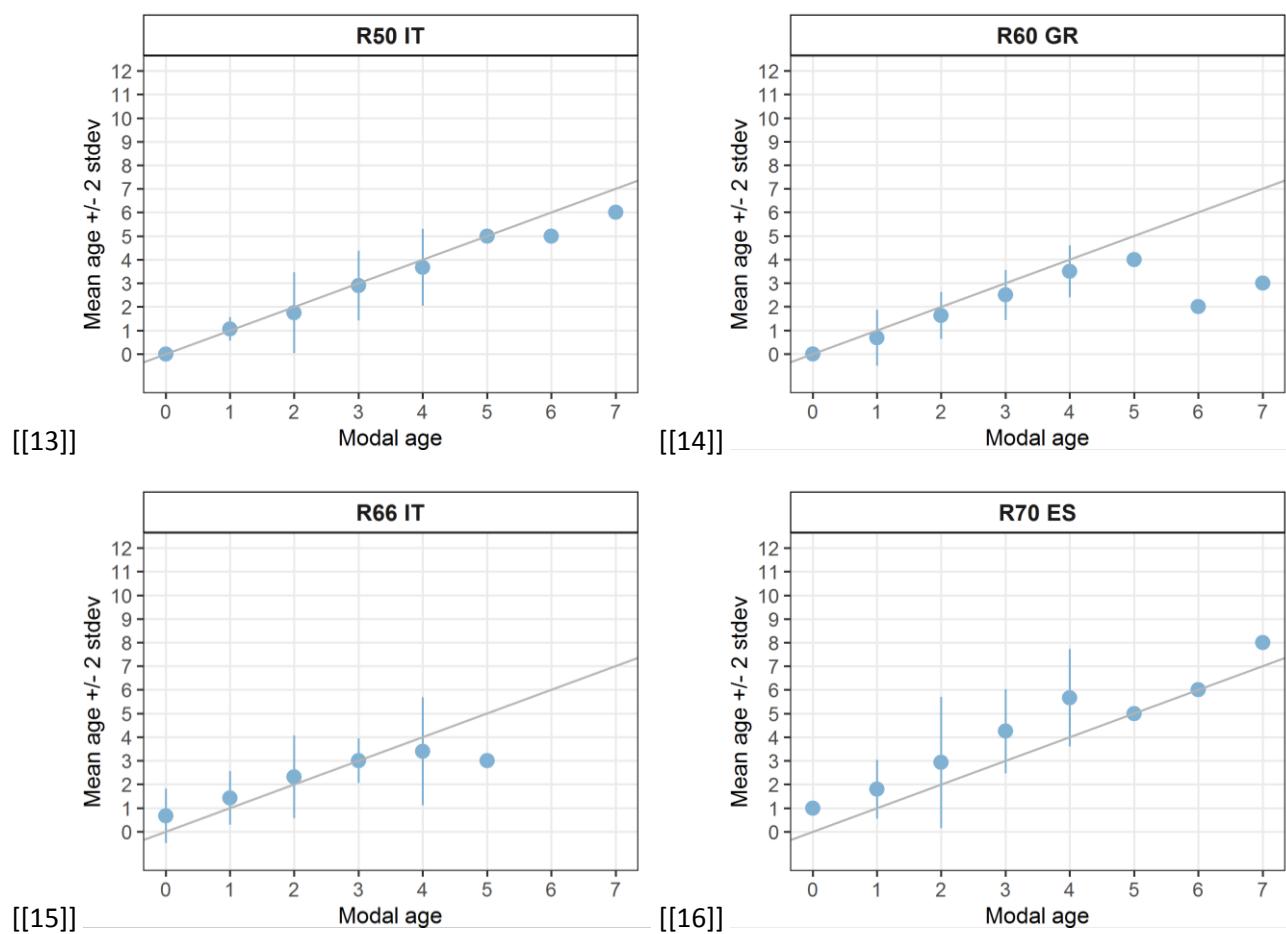

Figure 6.13: CV, PA and STDEV (standard deviation) are plotted against modal age

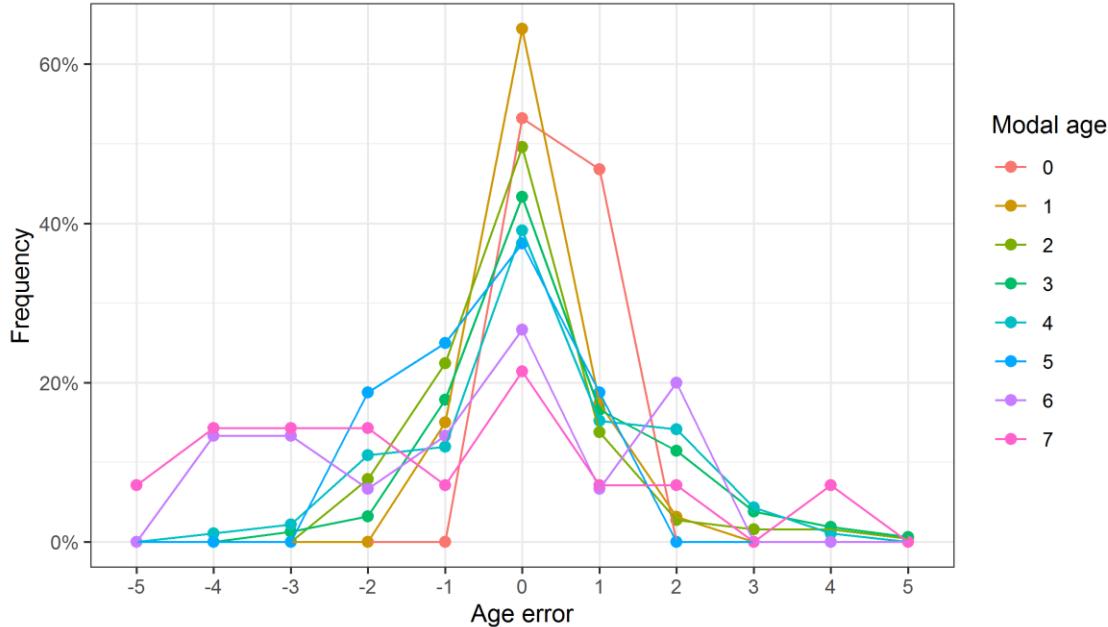

Figure 6.14: The distribution of the age reading errors in percentage by modal age as observed from the whole group of age readers in an age reading comparison to modal age. The achieved precision in age reading by MODAL age group is shown by the spread of the age readings errors. There appears to be no relative bias, if the age reading errors are normally distributed. The distributions are skewed, if relative bias occurs.

6.3.2 Advanced readers

These results were not included in the report because only one reader was considered as an expert and comparison inter-readers was not possible.

7 Annex 5. Recommendations

A new workshop including the readers involved in the age interpretation of these *Trachurus* species using otoliths is necessary.
